9.1 AI Engine CGRA . . . 43

9.1.1 Detailed Description . . . 44

9.1.2 Class Documentation . . . 45

9.1.2.1 class trisycl::vendor::xilinx::acap::aie::axi_stream_switch . . . 45

9.1.2.2 struct trisycl::vendor::xilinx::acap::aie::cascade_stream . . . 68

9.1.2.3 class trisycl::vendor::xilinx::acap::aie::axi_packet . . . 72

9.1.2.4 class trisycl::vendor::xilinx::acap::aie::dma_dsl . . . 75

9.1.2.5 struct trisycl::vendor::xilinx::acap::aie::geography . . . 81

9.1.2.6 struct trisycl::vendor::xilinx::acap::aie::layout::full . . . 116

9.1.2.7 struct trisycl::vendor::xilinx::acap::aie::layout::one_pe . . . 119

9.1.2.8 struct trisycl::vendor::xilinx::acap::aie::layout::size . . . 120

9.1.2.9 struct trisycl::vendor::xilinx::acap::aie::layout::small . . . 122

9.1.2.10 struct trisycl::vendor::xilinx::acap::aie::layout::ve1152 . . . 123

9.1.2.11 struct trisycl::vendor::xilinx::acap::aie::lock_unit . . . 124

9.1.2.12 struct trisycl::vendor::xilinx::acap::aie::memory . . . 127

9.1.2.13 struct trisycl::vendor::xilinx::acap::aie::memory_base . . . 129

9.1.2.14 class trisycl::vendor::xilinx::acap::aie::memory_infrastructure . . . 131

9.1.2.15 struct trisycl::vendor::xilinx::acap::aie::program . . . 134

9.1.2.16 struct trisycl::vendor::xilinx::acap::aie::queue . . . 153

9.1.2.17 class trisycl::vendor::xilinx::acap::aie::shim_tile . . . 161

9.1.2.18 struct trisycl::vendor::xilinx::acap::aie::tile . . . 180

9.1.2.19 class trisycl::vendor::xilinx::acap::aie::tile_base . . . 232

9.1.2.20 class trisycl::vendor::xilinx::acap::aie::tile_infrastructure . . . 243
9.1.2.21 class trisycl::vendor::xilinx::acap::aie::detail::tile_infrastructure . . . 265
9.2 Extensions for Xilinx ACAP Versal . . . 296
9.2.1 Detailed Description . . . 296
9.3 Debugging support for ACAP . . . 297
9.3.1 Detailed Description . . . 297
9.3.2 Class Documentation . . . 298
9.3.2.1 class trisycl::vendor::xilinx::acap::debug::bsp_checker . . . 298
9.4 Graphics support for CGRA-like interaction . . . 300
9.4.1 Detailed Description . . . 301
9.5 LaTeX support for graphics output . . . 301
9.5.1 Detailed Description . . . 301
9.6 Data access and storage in SYCL . . . 302
9.6.1 Detailed Description . . . 303
9.6.2 Class Documentation . . . 303
9.6.2.1 class trisycl::vendor::trisycl::pipe::cout . . . 303
9.6.2.2 class trisycl::accessor . . . 305
9.6.2.3 class trisycl::detail::accessor_base . . . 319
9.6.2.4 class trisycl::detail::accessor< T, Dimensions, Mode, access::target::local > . . . 321
9.6.2.5 class trisycl::buffer . . . 323
9.6.2.6 class trisycl::detail::accessor . . . 337
9.6.2.7 class trisycl::detail::buffer . . . 346
9.6.2.8 struct trisycl::detail::buffer_base . . . 356
9.6.2.9 class trisycl::detail::buffer_waiter . . . 368
9.6.2.10 struct trisycl::image . . . 370

Chapter 1

triSYCL implementation of SYCL

This is the main triSYCL C++ header file to experiment with the SYCL specification.

It declares everything into the `trisycl` namespace instead of `sycl` for SYCL 2020 or `cl::sycl` for SYCL 1.2.1 to express triSYCL specific extensions and to be used in full or partially with other SYCL implementations without naming conflict.

You can use sycl/sycl.hpp or CL/sycl.hpp headers instead to use this implementation with the usual `sycl` or `cl::sycl` namespaces.

For more information about SYCL: http://www.khronos.org/sycl/

For more information on this project and to access to the source of this file, look at https://github.com/triSYCL/triSYCL

The Doxygen version of the implementation itself is in http://trisycl.github.io/triSYCL/Doxygen/triSYCL/html and http://trisycl.github.io/triSYCL/Doxygen/triSYCL/triSYCL-implementation-refman.pdf

Chapter 2

Todo List

Member __global

avoid this hack

File address_space.hpp

Add the alias ..._ptr<T> = ...<T *>

Member const_func

avoid this hack

File opencl_spir_helpers.hpp

implement group and nd_item and to add nd_item to create_parallel_for_arg

File parallelism.hpp

Refactor this file

Namespace trisycl::access

This values should be normalized to allow separate compilation with different implementations?

Class trisycl::accessor< DataType, Dimensions, AccessMode, Target >

Implement it for images according so section 3.3.4.5

Member trisycl::accessor< DataType, Dimensions, AccessMode, Target >::accessor (buffer< DataType, Dimensions, Allocator > &target_buffer, handler &command_group_handler)

Add template allocator type in all the accessor constructors in the specification or just use a more opaque Buffer type?

fix specification where access mode should be target instead

Member trisycl::accessor< DataType, Dimensions, AccessMode, Target >::begin () const

Factor out these in a template helper

Add these functions to the specification

The fact that the lambda capture make a const copy of the accessor is not yet elegantly managed... The issue is that begin()/end() dispatch is made according to the accessor constness and not from the array member constness...

The issue is that the end may not be known if it is implemented by a raw OpenCL cl_mem... So only provide on the device the iterators related to the start? Actually the accessor needs to know a part of the shape to have the multidimentional addressing. So this only require a size_t more...

try to solve it by using some enable_if on array constness?

Member trisycl::accessor< DataType, Dimensions, AccessMode, Target >::dimensionality

in the specification: store the dimension for user request

Member trisycl::accessor< DataType, Dimensions, AccessMode, Target >::get_count () const

Move on https://cvs.khronos.org/bugzilla/show_bug.cgi?id=15564 and https://cvs.khronos.org/bugzilla/show_bug.cgi?id=14404

Member trisycl::accessor< DataType, Dimensions, AccessMode, Target >::get_pointer () const

Should it be named data() instead?

Member trisycl::accessor< DataType, Dimensions, AccessMode, Target >::get_range () const

Move on https://cvs.khronos.org/bugzilla/show_bug.cgi?id=15564 and https://cvs.khronos.org/bugzilla/show_bug.cgi?id=14404

Member trisycl::accessor< DataType, Dimensions, AccessMode, Target >::get_size () const

Move on https://cvs.khronos.org/bugzilla/show_bug.cgi?id=15564 and https://cvs.khronos.org/bugzilla/show_bug.cgi?id=14404

It is incompatible with buffer get_size() in the spec

Member trisycl::accessor< DataType, Dimensions, AccessMode, Target >::operator* ()

Add in the specification

Member trisycl::accessor< DataType, Dimensions, AccessMode, Target >::operator* () const

Add in the specification?

Add the concept of 0-dim buffer and accessor for scalar and use an implicit conversion to value_type reference to access the value with the accessor?

Member trisycl::accessor< DataType, Dimensions, AccessMode, Target >::operator[] (const nd_item< dimensionality > &index) const

Add in the specification because used by HPC-GPU slide 22

Member trisycl::accessor< DataType, Dimensions, AccessMode, Target >::operator[] (const nd_item< dimensionality > &index)

Add in the specification because used by HPC-GPU slide 22

Member trisycl::buffer (FIB begin, FIE end) -> buffer< typename std::iterator_traits< FIB >::value_type, 1 >

Use some standard concepts

Add this to SYCL Next

Member trisycl::buffer (auto &host_data) -> buffer< std::ranges::range_value_t< decltype(host_data)>, 1 >

Use some standard concepts

Add this to SYCL Next

Class trisycl::buffer< T, Dimensions, Allocator >

There is a naming inconsistency in the specification between buffer and accessor on T versus datatype

Finish allocator implementation

Think about the need of an allocator when constructing a buffer from other buffers

Update the specification to have a non-const allocator for const buffer? Or do we rely on rebind_alloc<T>. But does this work with astate-full allocator?

Add constructors from arrays so that in C++17 the range and type can be infered from the constructor

Add constructors from array_ref

Member trisycl::buffer< T, Dimensions, Allocator >::buffer (cl_mem mem_object, queue from_queue, event available_event={}, Allocator allocator={})

To be implemented

Improve the specification to allow CLHPP objects too

Member trisycl::buffer< T, Dimensions, Allocator >::buffer (shared_ptr_class< T > host_data, const range< Dimensions > &buffer_range, Allocator allocator={})

add this mutex-less constructor to the specification

Member trisycl::buffer< T, Dimensions, Allocator >::buffer (buffer< T, Dimensions, Allocator > &b, const id< Dimensions > &base_index, const range< Dimensions > &sub_range, Allocator allocator={})

To be implemented

Member trisycl::buffer< T, Dimensions, Allocator >::buffer (shared_ptr_class< T > &host_data, const range< Dimensions > &buffer_range, trisycl::mutex_class &m, Allocator allocator={})

update the specification to replace the pointer by a reference and provide the constructor with and without a mutex

Member trisycl::buffer< T, Dimensions, Allocator >::buffer (const T *host_data, const range< Dimensions > &r, Allocator allocator={})

Actually this is redundant.

Member trisycl::buffer< T, Dimensions, Allocator >::buffer (InputIterator start_iterator, InputIterator end_iterator, Allocator allocator={})

Implement the copy back at buffer destruction

Generalize this for n-D and provide column-major and row-major initialization

a reason to have this nD is that set_final_data(weak_ptr_class<T> & finalData) is actually doing this linearization anyway

Allow read-only buffer construction too

update the specification to deal with forward iterators instead and rewrite back only when it is non const and output iterator at least

Allow initialization from ranges and collections à la STL

Member trisycl::buffer< T, Dimensions, Allocator >::buffer (buffer< T, Dimensions, Allocator > &b, const id< Dimensions > &base_index, const range< Dimensions > &sub_range, Allocator allocator={})

Update the specification to replace index by id

Member trisycl::buffer< T, Dimensions, Allocator >::get_access (handler &command_group_handler)

Do we need for an accessor to increase the reference count of a buffer object? It does make more sense for a host-side accessor.

Implement the modes and targets

Member trisycl::buffer< T, Dimensions, Allocator >::get_access ()

More elegant solution

Implement the modes

Member trisycl::buffer< T, Dimensions, Allocator >::get_range () const

rename to the equivalent from array_ref proposals? Such as size() in http://www.open-std.org/jtc1/sc22/wg21/docs/papers/2016/p0009r2.html

Member trisycl::buffer< T, Dimensions, Allocator >::get_size () const

rename to something else. In http://www.open-std.org/jtc1/sc22/wg21/docs/papers/2015/p0122r0.pdf it is named bytes() for example

Member trisycl::buffer< T, Dimensions, Allocator >::is_read_only () const

Add to specification

Member trisycl::buffer< T, Dimensions, Allocator >::use_count () const

Add to the specification, useful for validation

Class trisycl::context

The implementation is quite minimal for now.

Member trisycl::context::get_devices () const

To be implemented

Member trisycl::context::get_info () const

To be implemented

Member trisycl::context::get_platform () const

To be implemented

Class trisycl::detail::accessor< T, Dimensions, Mode, access::target::local >

Implement a real local accessor handling several work-group running in parallel

Class trisycl::detail::accessor< T, Dimensions, Mode, Target >

Use the access::mode

Member trisycl::detail::accessor< T, Dimensions, Mode, Target >::accessor (std::shared_ptr< detail::buffer< T, Dimensions > > target_buffer)

fix the specification to rename target that shadows template parm

Member trisycl::detail::accessor< T, Dimensions, Mode, Target >::accessor (std::shared_ptr< detail::buffer< T, Dimensions > > target_buffer, handler &command_group_handler)

fix the specification to rename target that shadows template parm

Member trisycl::detail::accessor< T, Dimensions, Mode, Target >::is_read_access () const

to move in the access::mode enum class and add to the specification ?

Strangely, it is not really constexpr because it is not a static method...

Member trisycl::detail::accessor< T, Dimensions, Mode, Target >::is_write_access () const

to move in the access::mode enum class and add to the specification ?

Strangely, it is not really constexpr because it is not a static method...

Member trisycl::detail::accessor< T, Dimensions, Mode, Target >::register_accessor ()

Double-check with the C++ committee on this issue.

Member trisycl::detail::address_space_array< T, AS >::address_space_array (std::initializer_list< std::remove_extent_t< T > > list)

Extend to more than 1 dimension

Class trisycl::detail::address_space_base< T, AS >

Verify/improve to deal with const/volatile?

Member trisycl::detail::address_space_base< T, AS >::opencl_type

Add to the specification

Member trisycl::detail::address_space_base< T, AS >::type

Add to the specification

Class trisycl::detail::address_space_fundamental< T, AS >

Verify/improve to deal with const/volatile?

Class trisycl::detail::address_space_object< T, AS >

Verify/improve to deal with const/volatile?

what about T having some final methods?

Member trisycl::detail::address_space_object< T, AS >::opencl_type

Add to the specification

Member trisycl::detail::address_space_variable< T, AS >::opencl_type

Add to the specification

Member trisycl::detail::buffer< T, Dimensions >::alloc

Implement user-provided allocator

Member trisycl::detail::buffer< T, Dimensions >::buffer (const range< Dimensions > &r)

Lazily allocate memory since it might not be used on host

Member trisycl::detail::buffer< T, Dimensions >::buffer (const T *host_data, const range< Dimensions > &r)

Clarify the semantics in the spec. What happens if the host change the host_data after buffer creation?

Member trisycl::detail::buffer< T, Dimensions >::call_update_buffer_state (trisycl::context ctx, access::mode mode, size_t size, DataType *data, std::enable_if_t<!std::is_const< BaseType >::value > *=0)

Use `if constexpr` when it is available with C++17

Member trisycl::detail::buffer< T, Dimensions >::get_destructor_future ()

Make the function private again

Member trisycl::detail::buffer< T, Dimensions >::~buffer ()

To implement and deal with reference counting buffer(buffer<T, Dimensions> b, index<Dimensions> base_↩ index, range<Dimensions> sub_range)

Allow CLHPP objects too?

Member trisycl::detail::buffer_add_to_task (BufferDetail buf, handler *command_group_handler, bool is↩ _write_mode)

To remove with some refactoring

Member trisycl::detail::buffer_base::buffer_base ()

Use lazy allocation for the context tracking set

Member trisycl::detail::context::get_devices () const =0

virtual cannot be templated template <info::context Param> typename info::param_traits<info::context, Param>::type get_info() const = 0;

Class trisycl::detail::host_context

The implementation is quite minimal for now. :-)

Member trisycl::detail::host_context::get_devices () const override

To be implemented

Class trisycl::detail::host_device

The implementation is quite minimal for now. :-)

Member trisycl::detail::host_device::get_platform () const override

To be implemented

Member trisycl::detail::host_device::has_extension (const string_class &extension) const override

To be implemented

Member trisycl::detail::host_platform::has_extension (const string_class &extension) const override

To be implemented

Member trisycl::detail::opencl_context::get_devices () const override

To be implemented

Member trisycl::detail::opencl_context::get_platform () const override

To be implemented

Member trisycl::detail::opencl_kernel::get () const override

Test error and throw. Externalize this feature in Boost.Compute?

Improve the spec to deprecate C OpenCL host API and move to C++ instead to avoid this ugly ownership management

Member trisycl::detail::opencl_kernel::single_task (std::shared_ptr< detail::task > task, std::shared_ptr< detail::queue > q) override

Remove either task or q

Member trisycl::detail::opencl_queue::instance (const trisycl::device &d)

Check with SYCL committee what is the expected behaviour here about the context. Is this a new context everytime, or always the same for a given device?

Member trisycl::detail::parallel_for (nd_range< Dimensions > r, ParallelForFunctor f)

Add an OpenMP implementation

Deal with incomplete work-groups

Implement with parallel_for_workgroup()/parallel_for_workitem()

Member trisycl::detail::parallel_for_workitem (const group< Dimensions > &g, ParallelForFunctor f)

Better type the functor

Member trisycl::detail::queue::~queue ()

Update according spec since queue destruction is non blocking

Member trisycl::detail::shared_ptr_implementation< Parent, Implementation >::operator< (const Parent &lhs, const Parent &rhs)

Add this to the spec

Member trisycl::detail::sycl_2_2::pipe< T >::write (const T &value, bool blocking=false)

provide a && version

Member trisycl::detail::sycl_2_2::pipe_accessor< T, AccessMode, Target >::pipe_accessor (const std::shared_ptr< detail::sycl_2_2::pipe< T > > &p)

Use pipe_exception instead

Member trisycl::detail::sycl_2_2::pipe_accessor< T, AccessMode, Target >::write (const value_type &value) const

provide a && version

Member trisycl::detail::sycl_2_2::pipe_reservation< PipeAccessor >::assume_validity ()

Throw exception instead

Member trisycl::detail::sycl_2_2::pipe_reservation< PipeAccessor >::commit ()

Add to the specification that for simplicity a reservation can be commited several times but only the first one is taken into account

Member trisycl::detail::task::buffers_in_use

Use a set to check that some buffers are not used many times at least on writing

Member trisycl::detail::task::get_kernel ()

Specify this error in the spec

Member trisycl::detail::task::schedule (std::function< void(void)> f)

This is an issue if there is an exception in the kernel

Member trisycl::detail::vec< DataType, NumElements >::zip (::trisycl::vec< T, size > y, ::trisycl::vec< T, size > z, F f) const

this should be generalized to any arity

Member trisycl::device::device (const device_selector &ds)

Make it non-explicit in the specification?

Member trisycl::device::get_info () const

Member trisycl::device::type () const

Present in Boost.Compute, to be added to the specification

Member trisycl::device_selector::select_device () const

Remove this from specification

Class trisycl::device_type_selector

To be added to the specification

Class trisycl::device_typename_selector< DeviceType >

To be added to the specification

Member trisycl::drt::code::program::p

Deal with several programs

Member trisycl::drt::kernel_IR

use std::byte when moving to C++17

Member trisycl::error_handler::default_handler

add this concept to the specification?

Member trisycl::error_handler::report_error (exception &error)=0

Add "virtual void" to the specification

Class trisycl::exception_list

Do we need to define it in SYCL or can we rely on plain C++17 one?

Member trisycl::exception_ptr

Do we need this instead of reusing directly the one from C++11?

Member trisycl::facade::accessor< AccessorMixIn >::begin ()

Add these functions to the specification

Do we need this in detail::accessor too or only in accessor?

Factor out these in a template helper

The issue is that the end may not be known if it is implemented by a raw OpenCL cl_mem... So only provide on the device the iterators related to the start? Actually the accessor needs to know a part of the shape to have the multidimentional addressing. So this only require a size_t more...

try to solve it by using some enable_if on array constness?

The fact that the lambda capture make a const copy of the accessor is not yet elegantly managed... The issue is that begin()/end() dispatch is made according to the accessor constness and not from the array member constness...

Member trisycl::facade::accessor< AccessorMixIn >::get_pointer ()

Implement the various pointer address spaces

Member trisycl::facade::accessor< AccessorMixIn >::operator* () const

Add the concept of 0-dim buffer and accessor for scalar and use an implicit conversion to value_type reference to access the value with the accessor?

Add to the specification?

Member trisycl::facade::accessor< AccessorMixIn >::operator* ()

Add to the specification

Member trisycl::facade::accessor< AccessorMixIn >::operator[] (const nd_item< mixin::rank()> &index)

Add to the specification because used by HPC-GPU slide 22

Member trisycl::facade::accessor< AccessorMixIn >::operator[] (const nd_item< mixin::rank()> &index) const

Add to the specification because used by HPC-GPU slide 22

Member trisycl::group< Dimensions >::get_group_range () const

Fix this comment and the specification

Member trisycl::group< Dimensions >::get_local_range () const

Add to the specification

Member trisycl::group< Dimensions >::get_local_range (int dimension) const

Add to the specification

Member trisycl::group< Dimensions >::get_nd_range () const

Also provide this access to the current nd_range

Member trisycl::group< Dimensions >::get_offset (int dimension) const

Add to the specification

Member trisycl::group< Dimensions >::get_offset () const

Add to the specification

Member trisycl::group< Dimensions >::group (const nd_range< Dimensions > &ndr)

This should be private since it is only used by the triSYCL implementation

Member trisycl::group< Dimensions >::group (const id< Dimensions > &i, const nd_range< Dimensions > &ndr)

This should be private somehow, but it is used by the validation infrastructure

Member trisycl::group< Dimensions >::group ()=default

Make most of them protected, reserved to implementation

Member trisycl::group< Dimensions >::operator[] (int dimension)

In this implementation it is not const because the group<> is written in the parallel_for iterators. To fix according to the specification

Member trisycl::h_item< Dimensions >::get_item () const

Add to the specification

Member trisycl::h_item< Dimensions >::h_item (nd_range< Dimensions > ndr)

This is for the triSYCL implementation which is expected to call set_global() and set_local() later. This should be hidden to the user.

Member trisycl::h_item< Dimensions >::h_item (id< Dimensions > global_index, nd_range< Dimensions > ndr)

This is for validation purpose. Hide this to the programmer somehow

Member trisycl::h_item< Dimensions >::h_item ()=default

Make most of them protected, reserved to implementation

Member trisycl::handler::parallel_for (SYCLrange num_work_items, kernel sycl_kernel)

Add in the spec a version taking a kernel and a functor, to have host fall-back

Member trisycl::handler::parallel_for (nd_range< Dimensions >, kernel syclKernel)

Add in the spec a version taking a kernel and a functor, to have host fall-back

To be implemented

Member trisycl::handler::schedule_parallel_for_kernel (Kernel k, const range< N > &num_work_items)

Add host fall-back execution for parallel_for_kernel

Member trisycl::handler::set_arg (int arg_index, accessor< DataType, Dimensions, Mode, Target > &&acc_obj)

Update the specification to use a ref && to the accessor instead?

It is not that clean to have set_arg() associated to a command handler. Rethink the specification?

It seems more logical to have these methods on kernel instead

Member trisycl::handler::set_args (Ts &&... args)

Update the specification to add this function according to https://cvs.khronos.org/bugzilla/show_bug.cgi?id=15978 proposal

Member trisycl::handler::single_task (kernel sycl_kernel)

Add in the spec a version taking a kernel and a functor, to have host fall-back

Class trisycl::image< Dimensions >

implement image

Member trisycl::info::context

Should be unsigned int to be consistent with others?

Member trisycl::info::device

Should be unsigned int?

Member trisycl::info::device_type

there is no accelerator_selector and custom_accelerator

Add opencl to the specification

To be moved in the specification from platform to device

Member trisycl::info::TRISYCL_INFO_PARAM_TRAITS (info::device::image2d_max_width, size_t)

To be implemented, return always void.

Member trisycl::item< Dimensions, with_offset >::item ()=default

Make most of them protected, reserved to implementation

Member trisycl::item< Dimensions, with_offset >::set (id< Dimensions > Index)

Move to private and add friends

Class trisycl::kernel

To be implemented

Check specification

Member trisycl::make_ptr (T *pointer)

Implement the case with a plain pointer

Member trisycl::map_allocator

: implement and clarify the specification. It looks like it is not really an allocator according the current spec

Member trisycl::mixin::accessor< T, Dimensions >::get_count () const

Cache it since it is const?

Move these kinds of functions into a mixin between buffers and accessors?

Member trisycl::mixin::accessor< T, Dimensions >::get_range () const

Cache it since it is const?

Member trisycl::mixin::accessor< T, Dimensions >::get_size () const

Cache it since it is const?

rename to something else. In http://www.open-std.org/jtc1/sc22/wg21/docs/papers/2015/p0122r0.pdf it is named bytes() for example

Member trisycl::nd_item< Dimensions >::get_item () const

Add to the specification

Member trisycl::nd_item< Dimensions >::nd_item ()=default

Make most of them protected, reserved to implementation

Member trisycl::nd_item< Dimensions >::nd_item (id< Dimensions > global_index, nd_range< Dimensions > ndr)

This is for validation purpose. Hide this to the programmer somehow

Member trisycl::nd_item< Dimensions >::nd_item (nd_range< Dimensions > ndr)

This is for the triSYCL implementation which is expected to call set_global() and set_local() later. This should be hidden to the user.

Class trisycl::nd_range< Dimensions >

add copy constructors in the specification

Member trisycl::nd_range< Dimensions >::get_offset () const

get_offset() is lacking in the specification

Class trisycl::non_cl_error

Exceptions are named error in C++

Clean implementation

Add to the specification

Class trisycl::pipe< Name, T, MinCapacity, SizeT >

Bike-shed the naming & API according to current C++ proposals or libraries about static sized FIFO

Member trisycl::pipe< Name, T, MinCapacity, SizeT >::bit_ceil_at_least_2 (std::size_t value)

At some point use C++20 std::bit_ceil instead of this DIY function

Class trisycl::platform

triSYCL Implementation

Member trisycl::platform::get () const

Define a SYCL exception for this

Member trisycl::platform::get_info () const

Add to the specification

Class trisycl::program

To be implemented

Class trisycl::queue

All the queue methods should return a queue& instead of void to it is possible to chain opoerations

The implementation is quite minimal for now. :-)

Member trisycl::queue::queue (const boost::compute::command_queue &q, async_handler ah=nullptr)

Deal with handler

Member trisycl::queue::submit (Handler_Functor cgf)

Add in the spec an implicit conversion of event to queue& so it is possible to chain operations on the queue

Class trisycl::range< Dimensions >

add to the specification some way to specify an offset?

add to the specification this default parameter value?

use std::size_t Dimensions instead of int Dimensions in the specification?

Member trisycl::sycl_2_2::pipe_reservation< PipeAccessor >::pipe_reservation (detail::sycl_2_2::pipe_reservation< accessor_detail > &&pr)

Make it private and add required friends

Namespace trisycl::trisycl

Refactor when updating to latest specification

Member trisycl::vendor::trisycl::scope::detail::device< DeviceStorage, ScopedPlatform >::scope_storage

For now it is allocated on the host in this CPU emulation but a device compiler and runtime can create this on a real device

For now it is allocated on the host in this CPU emulation but a device compiler and runtime can create this on a real device

(Andrew Gozillon) FYI, until Intel fix the way they handle base classes in the SYCL compiler frontend this tile_base can never have non-default constructed data (on the device side implementation, the host should be fine to have whatever). As the hack I have in place just now only outlines a call to the base classes default constructor, it might be feasible to work around that though by calling a base class "fill" function in the tile

constructor or tweaking the way the run function of a tile is outlined so that it outlines it as a copy of the full object rather than components of the object and reconstructing it inside the kernel (although you'll fall into the standard layout trap as you'll be passing a full object to the kernel invocation and it'd take some reworking of the Tile's main generation).

(Andrew Gozillon) FYI, until Intel fix the way they handle base classes in the SYCL compiler frontend this tile_base can never have non-default constructed data (on the device side implementation, the host should be fine to have whatever). As the hack I have in place just now only outlines a call to the base classes default constructor, it might be feasible to work around that though by calling a base class "fill" function in the tile constructor or tweaking the way the run function of a tile is outlined so that it outlines it as a copy of the full object rather than components of the object and reconstructing it inside the kernel (although you'll fall into the standard layout trap as you'll be passing a full object to the kernel invocation and it'd take some reworking of the Tile's main generation).

Class trisycl::vendor::xilinx::partition::complete< PDim >

Deal with multi-dimension array. Now, since we can only deal with 1-dim, PDim is set to 1 by default.

Deal with multi-dimension array. Now, since we can only deal with 1-dim, PDim is set to 1 by default.

Class trisycl::vendor::xilinx::partition::cyclic< PhyMemNum, PDim >

Deal with multi-dimension array. Now, since we can only deal with 1-dim, PDim is set to 1 by default.

Deal with multi-dimension array. Now, since we can only deal with 1-dim, PDim is set to 1 by default.

Class trisycl::vendor::xilinx::partition_array< ValueType, Size, PartitionType >

Deal with multi-dimension array.

Deal with multi-dimension array.

Member trisycl::vendor::xilinx::partition_array< ValueType, Size, PartitionType >::partition_array (const SomeContainer &src)

Find a way to specialize this with a safer implementation when the size of src is at least constexpr

Member trisycl::vendor::xilinx::partition_array< ValueType, Size, PartitionType >::partition_array (std::initializer_list< SourceBasicType > l)

Find a way to specialize this with a safer implementation when the size of src is at least constexpr This does not work... static_assert(l.size() == Size);

Member trisycl::vendor::xilinx::partition_array< ValueType, Size, PartitionType >::partition_array (const SomeContainer &src)

Find a way to specialize this with a safer implementation when the size of src is at least constexpr

Member trisycl::vendor::xilinx::partition_array< ValueType, Size, PartitionType >::partition_array (std::initializer_list< SourceBasicType > l)

Find a way to specialize this with a safer implementation when the size of src is at least constexpr This does not work... static_assert(l.size() == Size);

Member TRISYCL_DEFINE_DEVICE_HOST_INFO_TEMPLATE (name, result)

To be implemented

Member TRISYCL_ParallelForKernel_RANGE (N)

Remove either task or q

Think to a cleaner solution

Think to a cleaner solution

Chapter 3

Module Index

3.1 Modules

Here is a list of all modules:

Extensions for Xilinx ACAP Versal . . . 296
AI Engine CGRA . . . 43
Debugging support for ACAP . . . 297
Graphics support for CGRA-like interaction . . . 300
LaTeX support for graphics output . . . 301
Data access and storage in SYCL . . . 302
triSYCL extension for storage scopes . . . 378
Xilinx vendor extensions . . . 418
Data access and storage in old version of SYCL . . . 432
Platforms, contexts, accessors and queues . . . 499
Dealing with OpenCL address spaces . . . 621
Helpers to do array and tuple conversion . . . 645
Some helpers for the implementation . . . 650
Debugging and tracing support . . . 665
Manage default configuration and types . . . 669
Opencl_spir_helpers . . . 672
Device-side runtime implementation . . . 675
Error handling . . . 681
Expressing parallelism through kernels . . . 709
Vector types in SYCL . . . 784

Chapter 4

Namespace Index

4.1 Namespace List

Here is a list of all namespaces with brief descriptions:

cl . . . 823
cl::sycl
The official SYCL 1.2.1 specification exposes the API in the cl::sycl namespace . . . 823
std . . . 823
sycl
Expose the SYCL API directly in the sycl namespace . . . 825
trisycl
The vector type to be used as SYCL vector . . . 825
trisycl::access
Describe the type of access by kernels . . . 840
trisycl::detail
Some global triSYCL configuration . . . 844
trisycl::detail::spir . . . 855
trisycl::detail::sycl_2_2 . . . 855
trisycl::drt
The device-side runtime . . . 855
trisycl::drt::code
The binary code of the kernels . . . 856
trisycl::extension . . . 856
trisycl::extension::ce . . . 857
trisycl::facade . . . 857
trisycl::info . . . 857
trisycl::mixin . . . 861
trisycl::native . . . 861
trisycl::property . . . 861
trisycl::property::queue . . . 862
trisycl::sycl_2_2 . . . 862
trisycl::trisycl . . . 862
trisycl::vendor . . . 862
trisycl::vendor::trisycl . . . 862
trisycl::vendor::trisycl::pipe . . . 863
trisycl::vendor::trisycl::random
Random generators . . . 863
trisycl::vendor::trisycl::scope . . . 863
trisycl::vendor::trisycl::scope::detail . . . 864

trisycl::vendor::xilinx 864
trisycl::vendor::xilinx::acap 866
trisycl::vendor::xilinx::acap::aie 866
trisycl::vendor::xilinx::acap::aie::detail 867
trisycl::vendor::xilinx::acap::aie::layout 868
trisycl::vendor::xilinx::acap::debug 869
trisycl::vendor::xilinx::graphics 869
trisycl::vendor::xilinx::latex 870
trisycl::vendor::xilinx::partition
Kind of array partition 870
trisycl::views 871

Chapter 5

Concept Index

5.1 Concepts

Here is a list of all concepts with brief descriptions:

trisycl::detail::is_small_array
Concept describing a class inheriting from small_array 875

Chapter 6

Hierarchical Index

6.1 Class Hierarchy

This inheritance list is sorted roughly, but not completely, alphabetically:

trisycl::mixin::accessor< T, Dimensions > . . . 499
  trisycl::facade::accessor< mixin::accessor< T, Dimensions > > . . . 499
    trisycl::detail::accessor< T, Dimensions, Mode, access::target::host_buffer > . . . 302
      trisycl::detail::accessor< T, Dimensions, Mode, access::target::local > . . . 302
    trisycl::detail::accessor< T, Dimensions, Mode, Target > . . . 302
trisycl::mixin::accessor< T, 1 > . . . 499
  trisycl::detail::buffer< T, Dimensions > . . . 302
trisycl::detail::accessor_base . . . 302
  trisycl::detail::accessor< T, Dimensions, Mode, access::target::host_buffer > . . . 302
  trisycl::detail::accessor< T, Dimensions, Mode, Target > . . . 302
AccessorMixIn . . . 884
  trisycl::facade::accessor< AccessorMixIn > . . . 499
trisycl::detail::address_space_base< T, AS > . . . 621
  trisycl::detail::address_space_object< T, AS > . . . 621
  trisycl::detail::address_space_variable< T, AS > . . . 621
    trisycl::detail::address_space_array< T, AS > . . . 621
    trisycl::detail::address_space_fundamental< T, AS > . . . 621
      trisycl::detail::address_space_ptr< T, AS > . . . 621
boost::fibers::algo::algorithm
  trisycl::detail::pooled_shared_work . . . 1174
  trisycl::detail::pooled_work_stealing . . . 1181
trisycl::detail::alignment< T > . . . 884
trisycl::detail::alignment<::trisycl::vec< DataType, NumElements > > . . . 885
trisycl::vendor::xilinx::graphics::application . . . 887
Gtk::ApplicationWindow
  trisycl::vendor::xilinx::graphics::frame_grid . . . 1054
    trisycl::vendor::xilinx::graphics::image_grid . . . 1079
    trisycl::vendor::xilinx::graphics::image_grid . . . 1079
  trisycl::vendor::xilinx::graphics::frame_grid . . . 1054
std::array
  trisycl::detail::small_array< DataType, ::trisycl::vec< DataType, NumElements >, NumElements > . . . 650
    trisycl::detail::vec< DataType, 1 > . . . 1302
      trisycl::vec< DataType, 1 > . . . 784

trisycl::detail::vec< DataType, 16 > . . . 1302
trisycl::vec< DataType, 16 > . . . 784
trisycl::detail::vec< DataType, 2 > . . . 1302
trisycl::vec< DataType, 2 > . . . 784
trisycl::detail::vec< DataType, 3 > . . . 1302
trisycl::vec< DataType, 3 > . . . 784
trisycl::detail::vec< DataType, 4 > . . . 1302
trisycl::vec< DataType, 4 > . . . 784
trisycl::detail::vec< DataType, 8 > . . . 1302
trisycl::vec< DataType, 8 > . . . 784
trisycl::detail::vec< DataType, NumElements > . . . 1302
trisycl::detail::small_array< std::size_t, id< 1 >, Dims > . . . 650
trisycl::detail::small_array_sycl< std::size_t, id< 1 >, 1 > . . . 650
trisycl::id< Dimensions > . . . 709
trisycl::detail::small_array< std::size_t, range< 1 >, Dims > . . . 650
trisycl::detail::small_array_sycl< std::size_t, range< 1 >, 1 > . . . 650
trisycl::range< Dimensions > . . . 709
trisycl::detail::small_array< std::size_t, id< Dimensions >, Dims > . . . 650
trisycl::detail::small_array_sycl< std::size_t, id< Dimensions >, Dimensions > . . . 650
trisycl::id< Dimensions > . . . 709
trisycl::id< rank()> . . . 709
trisycl::id< 1 > . . . 709
trisycl::detail::small_array< std::size_t, range< Dimensions >, Dims > . . . 650
trisycl::detail::small_array_sycl< std::size_t, range< Dimensions >, Dimensions > . . . 650
trisycl::range< rank()> . . . 709
trisycl::range< 1 > . . . 709
trisycl::detail::small_array< BasicType, FinalType, Dims > . . . 650
trisycl::detail::small_array_sycl< BasicType, FinalType, Dims > . . . 650
trisycl::vendor::xilinx::acap::aie::axi_packet . . . 43
trisycl::vendor::xilinx::acap::aie::connection::base . . . 895
trisycl::vendor::xilinx::acap::aie::connection::input . . . 1096
trisycl::vendor::xilinx::acap::aie::connection::input . . . 1096
trisycl::vendor::xilinx::acap::aie::connection::output . . . 1142
trisycl::vendor::xilinx::acap::aie::connection::output . . . 1142
trisycl::vendor::xilinx::partition::block< ElmInEachPhyMem, PDim > . . . 899
trisycl::detail::bool_pack<... > . . . 901
trisycl::vendor::xilinx::acap::debug::bsp_checker< Geography > . . . 297
trisycl::detail::cache< Key, Value > . . . 901
trisycl::detail::cache< cl_command_queue, trisycl::detail::opencl_queue > . . . 901
trisycl::detail::cache< cl_context, trisycl::detail::opencl_context > . . . 901

Chapter 7

Class Index

7.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

trisycl::vendor::xilinx::acap::aie::accessor< Buffer >
Create a SYCL-like device view of an AI Engine CGRA with some layout . . . 877
AccessorMixIn . . . 884
trisycl::detail::alignment< T > . . . 884
trisycl::detail::alignment<::trisycl::vec< DataType, NumElements > > . . . 885
trisycl::vendor::xilinx::graphics::application
A graphics application running in a separate thread to display images in a grid of tiles . . . 887
trisycl::vendor::xilinx::acap::aie::connection::base
Base class of connection port . . . 895
trisycl::vendor::xilinx::partition::block< ElmInEachPhyMem, PDim >
Represent a block partition . . . 899
trisycl::detail::bool_pack<... > . . . 901
trisycl::detail::cache< Key, Value >
A simple thread safe cache mechanism to cache std::shared_ptr of values indexed by keys . . . 901
trisycl::vendor::xilinx::acap::aie::tile_infrastructure< Geography >::cgh_t . . . 906
trisycl::vendor::trisycl::scope::queue< Device, QueueStorage >::command_group< CGH >
The command group redefining some member functions to be able to pass the scope and so on to the kernel . . . 909
trisycl::vendor::xilinx::acap::aie::communicator_port
Abstract interface for a communication port . . . 916
trisycl::vendor::xilinx::partition::complete< PDim >
Represent a complete partition . . . 923
trisycl::vendor::xilinx::acap::aie::connection
A connection between some AXI Stream Switch . . . 925
trisycl::vendor::xilinx::latex::context . . . 928
trisycl::vendor::xilinx::acap::aie::geography< Layout >::core_axi_stream_switch . . . 935
trisycl::vendor::xilinx::partition::cyclic< PhyMemNum, PDim >
Represent a cyclic partition . . . 961
detail::debug< buffer< T, 1, buffer_allocator< std::remove_const_t< T > > > > . . . ??
detail::debug< buffer_waiter< T, 1, buffer_allocator< std::remove_const_t< T > > > > . . . ??
trisycl::trisycl::default_error_handler . . . 963
trisycl::vendor::xilinx::acap::aie::detail::device< Layout >
Create a SYCL-like device view of an AI Engine CGRA with some layout . . . 965
trisycl::vendor::xilinx::acap::aie::device< Layout >
Create a SYCL-like device view of an AI Engine CGRA with some layout . . . 990

trisycl::vendor::xilinx::acap::aie::dma< AXIStreamSwitch, SpecializedDMA >
Generic DMA . . . 1015
trisycl::property::queue::enable_profiling . . . 1028
trisycl::detail::event . . . 1029
trisycl::event
SYCL event . . . 1032
trisycl::detail::fiber_pool . . . 1038
trisycl::vendor::xilinx::acap::aie::fifo_channel
A FIFO channel connection . . . 1048
trisycl::vendor::xilinx::graphics::frame_grid
An application window displaying a grid of tiles . . . 1054
trisycl::half . . . 1061
std::hash< trisycl::buffer< T, Dimensions, Allocator > > . . . 1061
std::hash< trisycl::context > . . . 1062
std::hash< trisycl::device > . . . 1063
std::hash< trisycl::event > . . . 1064
std::hash< trisycl::kernel > . . . 1065
std::hash< trisycl::platform > . . . 1066
std::hash< trisycl::queue > . . . 1067
trisycl::detail::host_device
SYCL host device . . . 1068
trisycl::detail::host_event . . . 1072
trisycl::detail::host_queue
Some implementation details about the SYCL queue . . . 1076
trisycl::vendor::xilinx::graphics::image_grid
An application window displaying a grid of tiled images . . . 1079
trisycl::vendor::xilinx::acap::aie::connection::input
Abstract an input port . . . 1096
trisycl::vendor::xilinx::acap::aie::axi_stream_switch< AXIStreamGeography >::input_port . . . 1100
trisycl::detail::is_range< T >
A type trait to check if a type it a sycl::range or not . . . 1101
trisycl::detail::is_range< range< Dimensions > >
Return true if template instantiating match a sycl::range . . . 1103
trisycl::is_wrapper< T > . . . 1104
Layout . . . 1105
trisycl::vendor::xilinx::acap::aie::lock_unit::locking_device
The individual locking system . . . 1105
trisycl::vendor::xilinx::partition::none
Represent a none partition . . . 1110
trisycl::detail::opencl_context
SYCL OpenCL context . . . 1111
trisycl::detail::opencl_device
SYCL OpenCL device . . . 1118
trisycl::detail::opencl_event . . . 1126
trisycl::detail::opencl_kernel
An abstraction of the OpenCL kernel . . . 1131
trisycl::detail::opencl_queue
Some implementation details about the SYCL queue . . . 1136
trisycl::vendor::xilinx::acap::aie::connection::output
Abstract an output port . . . 1142
trisycl::vendor::xilinx::acap::aie::axi_stream_switch< AXIStreamGeography >::output_port . . . 1146
trisycl::vendor::xilinx::graphics::palette
Color palette to project a linear data space to an RGB color space . . . 1147
trisycl::info::param_traits< T, Param >
Implement a meta-function from (T, value) to T' to express the return type value of an OpenCL function of kind (T, value) . . . 1170
trisycl::detail::pooled_shared_work::pool_ctx
Shared storage among the working threads . . . 1170

trisycl::detail::pooled_work_stealing::pool_ctx
Shared storage among the working threads . . . 1172
trisycl::detail::pooled_shared_work . . . 1174
trisycl::detail::pooled_work_stealing . . . 1181
trisycl::vendor::xilinx::acap::aie::port
Abstraction of a communication port . . . 1189
trisycl::vendor::xilinx::acap::aie::port_receiver< AXIStreamSwich >
A router input port directing to an AIE core input or a BLI input . . . 1190
trisycl::detail::program . . . 1198
trisycl::drt::code::program
A binary program containing some kernels . . . 1199
trisycl::program
SYCL program . . . 1202
trisycl::detail::property . . . 1206
trisycl::property_list
SYCL property list . . . 1207
trisycl::detail::queue
Some implementation details about the SYCL queue . . . 1210
trisycl::vendor::xilinx::acap::aie::queue< AIEDevice >::queue_waiter
Provide a wait() function that actually can throw an exception instead of ignoring it by the std↩
::future::wait() . . . 1216
trisycl::vendor::xilinx::acap::aie::receiving_dma< AXIStreamSwitch >
Receiving DMA . . . 1218
trisycl::vendor::xilinx::acap::aie::axi_stream_switch< AXIStreamGeography >::router_minion
A router input port with routing skills . . . 1226
trisycl::vendor::xilinx::acap::aie::sending_dma< AXIStreamSwitch >
Sending DMA . . . 1241
trisycl::detail::shared_ptr_implementation< Parent, Implementation >
Provide an implementation as shared_ptr with total ordering and hashing to be used with algorithms and in (un)ordered containers . . . 1245
detail::shared_ptr_implementation< buffer_waiter< T, 1, buffer_allocator< std::remove_const_t< T > > >, detail::buffer< T, 1 >
??
trisycl::vendor::xilinx::acap::aie::port::shim
Abstraction of a communication port inside a shim tile . . . 1250
trisycl::vendor::xilinx::acap::aie::geography< Layout >::shim_axi_stream_switch . . . 1251
trisycl::vendor::xilinx::acap::aie::axi_packet::shutdown_t
Marker type used to signal network shutdown . . . 1272
trisycl::detail::singleton< T >
Provide a singleton factory . . . 1273
trisycl::vendor::trisycl::scope::detail::storage_type_trait< ScopedType, StorageType > . . . 1274
trisycl::vendor::trisycl::scope::detail::storage_type_trait< ScopedType, typename ScopedType::storage_type >
1275
trisycl::detail::task
The abstraction to represent SYCL tasks executing inside command_group . . . 1276
trisycl::vendor::xilinx::acap::aie::port::tile
Abstraction of a communication port inside a tile . . . 1293
trisycl::mixin::accessor< T, Dimensions >::track_index< N >
Proxy object to transform an expression like accessor[i1][i2][i3] into the implementation mdp-san(i1,i2,i3) one index at a time . . . 1294
std::tuple_element< I, T >
Each tuple element type is the same, the one of any small_array heir element . . . 1297
std::tuple_element< I, trisycl::vec< T, Size > >
The std::tuple_element specialization for vec . . . 1298
std::tuple_size< T >
Export the dimension as its tuple size . . . 1299
std::tuple_size< trisycl::vec< T, Size > >
The std::tuple_size specialization for vec . . . 1300

trisycl::vendor::xilinx::acap::aie::layout::vc1902
Describe the layout of a Versal VC1902 device 1301
trisycl::detail::vec< DataType, NumElements >
Forward declaration to use in the detail class 1302
trisycl::vec< typename, int >
Forward declaration to use in the detail class 1315
trisycl::vendor::trisycl::random::xorshift< Nbits >
A possible implementation of the xorshift RNGs from 1316

Chapter 8

File Index

8.1 File List

Here is a list of all files with brief descriptions:

include/CL/sycl.hpp
: This is the main SYCL 1.2.1 interoperability header to expose triSYCL into the `cl::sycl` namespace . . . 1325

include/sycl/sycl.hpp
: This is the SYCL extension header to expose triSYCL directly into the sycl namespace as expected by SYCL 2020 . . . 1326

include/sycl/vendor/triSYCL/scope.hpp . . . 1883

include/sycl/vendor/triSYCL/pipe/cout.hpp . . . 1876

include/sycl/vendor/triSYCL/random/xorshift.hpp . . . 1878

include/sycl/vendor/triSYCL/scope/device.hpp . . . 1975

include/sycl/vendor/triSYCL/scope/platform.hpp . . . 1889

include/sycl/vendor/triSYCL/scope/queue.hpp . . . 2126

include/sycl/vendor/triSYCL/scope/detail/util.hpp . . . 1886

include/sycl/vendor/triSYCL/scope/device/detail/device.hpp . . . 1978

include/sycl/vendor/triSYCL/scope/platform/detail/platform.hpp . . . 1892

include/sycl/vendor/triSYCL/scope/queue/detail/queue.hpp . . . 2130

include/sycl/vendor/Xilinx/acap.hpp
: Experimenting with CGRA & processor arrays such as ACAP/AI Engine . . . 1907

include/sycl/vendor/Xilinx/config.hpp
: Control the configuration of some implementation of Xilinx-related features . . . 2222

include/sycl/vendor/Xilinx/fpga.hpp . . . 2226

include/sycl/vendor/Xilinx/graphics.hpp . . . 2241

include/sycl/vendor/Xilinx/latex.hpp . . . 2260

include/sycl/vendor/Xilinx/acap/aie.hpp
: Experimenting with CGRA & processor arrays such as ACAP/AI Engine . . . 1910

include/sycl/vendor/Xilinx/acap/debug.hpp
: Some debugging utilities for ACAP . . . 2208

include/sycl/vendor/Xilinx/acap/aie/accessor.hpp
: SYCL accessor for AIE tile device . . . 1913

include/sycl/vendor/Xilinx/acap/aie/axi_stream_switch.hpp
: Model of an AXI stream switch . . . 1935

include/sycl/vendor/Xilinx/acap/aie/cascade_stream.hpp
: The cascade stream infrastructure between AI Engine tiles . . . 1955

include/sycl/vendor/Xilinx/acap/aie/connection.hpp . . . 1961

include/sycl/vendor/Xilinx/acap/aie/device.hpp
: SYCL-friendly device view of AIE . . . 1979

include/sycl/vendor/Xilinx/acap/aie/dma.hpp
Model of a tile DMA . . . 2020
include/sycl/vendor/Xilinx/acap/aie/geography.hpp
Geographic information about the AI Engine CGRA . . . 2033
include/sycl/vendor/Xilinx/acap/aie/layout.hpp
Some examples of AI Engine array layouts . . . 2057
include/sycl/vendor/Xilinx/acap/aie/lock.hpp
The lock mechanism used by some AI Engine tiles . . . 2086
include/sycl/vendor/Xilinx/acap/aie/memory.hpp
The basic AI Engine heterogeneous Memory Module (i.e . . . 2093
include/sycl/vendor/Xilinx/acap/aie/memory_base.hpp
The basic AI Engine homogeneous Memory Module, with the common infrastructure to all the memory modules (i.e . . . 2100
include/sycl/vendor/Xilinx/acap/aie/memory_infrastructure.hpp
The basic AI Engine homogeneous memory infrastructure, i.e . . . 2106
include/sycl/vendor/Xilinx/acap/aie/program.hpp
Model of an AI Engine program, that weaves the program of each tile with the memory of each tile for a given device . . . 2112
include/sycl/vendor/Xilinx/acap/aie/queue.hpp
SYCL-friendly queue for AIE cooperative program including all the tiles . . . 2132
include/sycl/vendor/Xilinx/acap/aie/shim_tile.hpp
Model of a shim tile between the AI array and the rest of the circuit . . . 2157
include/sycl/vendor/Xilinx/acap/aie/tile.hpp
The basic AI Engine heterogeneous tile that dependent of x & y coordinates but also from the collective program run on it . . . 2164
include/sycl/vendor/Xilinx/acap/aie/tile_base.hpp
The basic AI Engine homogeneous tile, with common content to all the tiles (i.e . . . 2178
include/sycl/vendor/Xilinx/acap/aie/tile_infrastructure.hpp
The basic AI Engine homogeneous tile, with the common infrastructure to all the tiles, i.e . . . 2186
include/sycl/vendor/Xilinx/acap/aie/device/detail/device.hpp
SYCL-friendly device view of AIE . . . 1984
include/sycl/vendor/Xilinx/acap/aie/layout/full.hpp
Layout for a AI Engine array with 5∗6 PE . . . 2061
include/sycl/vendor/Xilinx/acap/aie/layout/one_pe.hpp
Layout for a AI Engine array with 1 PE only . . . 2065
include/sycl/vendor/Xilinx/acap/aie/layout/size.hpp
Flexible layout for a AI Engine array with any 2D size . . . 2070
include/sycl/vendor/Xilinx/acap/aie/layout/small.hpp
Layout for a AI Engine array with a few PE only . . . 2075
include/sycl/vendor/Xilinx/acap/aie/layout/versal.hpp
Layout for some Xilinx Versal products . . . 2080
include/sycl/vendor/Xilinx/acap/aie/tile_infrastructure/detail/tile_infrastructure.hpp
The basic AI Engine homogeneous tile, with the common infrastructure to all the tiles, i.e . . . 2191
include/sycl/vendor/Xilinx/acap/tests/processor_array.cpp . . . 2218
include/sycl/vendor/Xilinx/fpga/opt_decorate_func.hpp . . . 2228
include/sycl/vendor/Xilinx/fpga/partition_array.hpp . . . 2231
include/sycl/vendor/Xilinx/fpga/ssdm_inst.hpp . . . 2239
include/triSYCL/access.hpp . . . 1331
include/triSYCL/accessor.hpp . . . 1915
include/triSYCL/address_space.hpp
Implement OpenCL address spaces in SYCL with C++-style . . . 1337
include/triSYCL/allocator.hpp . . . 1349
include/triSYCL/buffer.hpp . . . 1351
include/triSYCL/buffer_allocator.hpp . . . 1373
include/triSYCL/context.hpp . . . 1380
include/triSYCL/device.hpp . . . 1989
include/triSYCL/device_runtime.hpp . . . 1702
include/triSYCL/device_selector.hpp . . . 1706

include/triSYCL/error_handler.hpp . . . 1711
include/triSYCL/event.hpp . . . 1713
include/triSYCL/exception.hpp . . . 1724
include/triSYCL/group.hpp . . . 1728
include/triSYCL/h_item.hpp . . . 1732
include/triSYCL/half.hpp . . . 1736
include/triSYCL/handler.hpp . . . 1737
include/triSYCL/id.hpp . . . 1745
include/triSYCL/image.hpp
OpenCL SYCL image class . . . 1747
include/triSYCL/item.hpp . . . 1750
include/triSYCL/kernel.hpp . . . 1753
include/triSYCL/math.hpp
Implement a wrapper around OpenCL math operations Joan.Thibault AT ens-rennes POINT fr
This file is distributed under the University of Illinois Open Source License . . . 1763
include/triSYCL/nd_item.hpp . . . 1772
include/triSYCL/nd_range.hpp . . . 1776
include/triSYCL/opencl_types.hpp
TriSYCL wrapper for OpenCL types . . . 1778
include/triSYCL/parallelism.hpp
Implement parallel constructions to launch kernels . . . 1786
include/triSYCL/pipe.hpp . . . 1824
include/triSYCL/platform.hpp . . . 1896
include/triSYCL/program.hpp . . . 2117
include/triSYCL/property_list.hpp . . . 1810
include/triSYCL/queue.hpp . . . 2138
include/triSYCL/range.hpp . . . 1819
include/triSYCL/rounding_mode.hpp
Define rounding modes used in SYCL . . . 1822
include/triSYCL/sycl.hpp . . . 1328
include/triSYCL/vec.hpp
Implement the small vector class . . . 1851
include/triSYCL/accessor/detail/accessor_base.hpp . . . 1332
include/triSYCL/accessor/detail/local_accessor.hpp . . . 1335
include/triSYCL/accessor/facade/accessor.hpp . . . 1922
include/triSYCL/accessor/mixin/accessor.hpp . . . 1925
include/triSYCL/address_space/detail/address_space.hpp
Implement OpenCL address spaces in SYCL with C++-style . . . 1341
include/triSYCL/buffer/detail/accessor.hpp . . . 1929
include/triSYCL/buffer/detail/buffer.hpp . . . 1359
include/triSYCL/buffer/detail/buffer_base.hpp . . . 1365
include/triSYCL/buffer/detail/buffer_waiter.hpp . . . 1370
include/triSYCL/command_group/detail/task.hpp . . . 1375
include/triSYCL/context/detail/context.hpp . . . 1385
include/triSYCL/context/detail/context_tail.hpp . . . 1389
include/triSYCL/context/detail/host_context.hpp . . . 1390
include/triSYCL/context/detail/opencl_context.hpp . . . 1392
include/triSYCL/detail/alignment_helper.hpp
A simple trait to help generate the appropriate alignment data for a SYCL type when specified appropriately . . . 1395
include/triSYCL/detail/all_true.hpp . . . 1398
include/triSYCL/detail/array_tuple_helpers.hpp
Some helpers to do array-tuple conversions . . . 1399
include/triSYCL/detail/cache.hpp . . . 1402
include/triSYCL/detail/container_element_aspect.hpp . . . 1405
include/triSYCL/detail/debug.hpp . . . 2210
include/triSYCL/detail/default_classes.hpp . . . 1406

include/triSYCL/detail/enum.hpp
Some enum-related helpers . . . 1409
include/triSYCL/detail/fiber_pool.hpp
A Boost.Fiber pool implemented on a std::thread pool . . . 1419
include/triSYCL/detail/global_config.hpp . . . 1423
include/triSYCL/detail/instantiate_kernel.hpp . . . 1427
include/triSYCL/detail/linear_id.hpp . . . 1430
include/triSYCL/detail/metaprogramming.hpp . . . 1431
include/triSYCL/detail/overloaded.hpp . . . 1433
include/triSYCL/detail/property.hpp . . . 1434
include/triSYCL/detail/ranges.hpp
Some range-related helpers . . . 1435
include/triSYCL/detail/shared_ptr_implementation.hpp . . . 1438
include/triSYCL/detail/singleton.hpp . . . 1440
include/triSYCL/detail/small_array.hpp . . . 1442
include/triSYCL/detail/unimplemented.hpp . . . 1689
include/triSYCL/detail/fiber/pooled_shared_work.hpp . . . 1411
include/triSYCL/detail/fiber/pooled_work_stealing.hpp . . . 1415
include/triSYCL/detail/SPIR/opencl_spir.h . . . 1449
include/triSYCL/detail/SPIR/opencl_spir_helpers.hpp
Adds helper functions to populate Id's and Range's with OpenCL SPIR intrinsics data: e.g . . . 1670
include/triSYCL/detail/SPIR/opencl_spir_req.h . . . 1673
include/triSYCL/device/detail/device.hpp . . . 1994
include/triSYCL/device/detail/device_tail.hpp . . . 1691

include/triSYCL/vec/detail/swiz4.hpp . . . 1868
include/triSYCL/vec/detail/swiz_rgba.hpp . . . 1872
include/triSYCL/vec/detail/vec.hpp
Implement the detail base SYCL vector class . . . 1860
include/triSYCL/vendor/triSYCL/scope.hpp . . . 1885
include/triSYCL/vendor/triSYCL/pipe/cout.hpp . . . 1877
include/triSYCL/vendor/triSYCL/random/xorshift.hpp . . . 1881
include/triSYCL/vendor/triSYCL/scope/device.hpp . . . 2004
include/triSYCL/vendor/triSYCL/scope/platform.hpp . . . 1903
include/triSYCL/vendor/triSYCL/scope/queue.hpp . . . 2147
include/triSYCL/vendor/triSYCL/scope/detail/util.hpp . . . 1888
include/triSYCL/vendor/triSYCL/scope/device/detail/device.hpp . . . 2008
include/triSYCL/vendor/triSYCL/scope/platform/detail/platform.hpp . . . 1906
include/triSYCL/vendor/triSYCL/scope/queue/detail/queue.hpp . . . 2151
include/triSYCL/vendor/Xilinx/acap.hpp
Experimenting with CGRA & processor arrays such as ACAP/AI Engine . . . 1908
include/triSYCL/vendor/Xilinx/config.hpp
Control the configuration of some implementation of Xilinx-related features . . . 2223
include/triSYCL/vendor/Xilinx/fpga.hpp . . . 2226
include/triSYCL/vendor/Xilinx/graphics.hpp . . . 2251
include/triSYCL/vendor/Xilinx/latex.hpp . . . 2263
include/triSYCL/vendor/Xilinx/acap/aie.hpp
Experimenting with CGRA & processor arrays such as ACAP/AI Engine . . . 1911
include/triSYCL/vendor/Xilinx/acap/debug.hpp
Some debugging utilities for ACAP . . . 2215
include/triSYCL/vendor/Xilinx/acap/aie/accessor.hpp
SYCL accessor for AIE tile device . . . 1933
include/triSYCL/vendor/Xilinx/acap/aie/axi_stream_switch.hpp
Model of an AXI stream switch . . . 1945
include/triSYCL/vendor/Xilinx/acap/aie/cascade_stream.hpp
The cascade stream infrastructure between AI Engine tiles . . . 1958
include/triSYCL/vendor/Xilinx/acap/aie/connection.hpp . . . 1968
include/triSYCL/vendor/Xilinx/acap/aie/device.hpp
SYCL-friendly device view of AIE . . . 2010
include/triSYCL/vendor/Xilinx/acap/aie/dma.hpp
Model of a tile DMA . . . 2027
include/triSYCL/vendor/Xilinx/acap/aie/geography.hpp
Geographic information about the AI Engine CGRA . . . 2045
include/triSYCL/vendor/Xilinx/acap/aie/layout.hpp
Some examples of AI Engine array layouts . . . 2059
include/triSYCL/vendor/Xilinx/acap/aie/lock.hpp
The lock mechanism used by some AI Engine tiles . . . 2089
include/triSYCL/vendor/Xilinx/acap/aie/memory.hpp
The basic AI Engine heterogeneous Memory Module (i.e . . . 2097
include/triSYCL/vendor/Xilinx/acap/aie/memory_base.hpp
The basic AI Engine homogeneous Memory Module, with the common infrastructure to all the memory modules (i.e . . . 2103
include/triSYCL/vendor/Xilinx/acap/aie/memory_infrastructure.hpp
The basic AI Engine homogeneous memory infrastructure, i.e . . . 2109

include/triSYCL/vendor/Xilinx/acap/aie/program.hpp
Model of an AI Engine program, that weaves the program of each tile with the memory of each tile for a given device . . . 2121
include/triSYCL/vendor/Xilinx/acap/aie/queue.hpp
SYCL-friendly queue for AIE cooperative program including all the tiles . . . 2153
include/triSYCL/vendor/Xilinx/acap/aie/shim_tile.hpp
Model of a shim tile between the AI array and the rest of the circuit . . . 2160
include/triSYCL/vendor/Xilinx/acap/aie/tile.hpp
The basic AI Engine heterogeneous tile that dependent of x & y coordinates but also from the collective program run on it . . . 2171
include/triSYCL/vendor/Xilinx/acap/aie/tile_base.hpp
The basic AI Engine homogeneous tile, with common content to all the tiles (i.e . . . 2181
include/triSYCL/vendor/Xilinx/acap/aie/tile_infrastructure.hpp
The basic AI Engine homogeneous tile, with the common infrastructure to all the tiles, i.e . . . 2197
include/triSYCL/vendor/Xilinx/acap/aie/device/detail/device.hpp
SYCL-friendly device view of AIE . . . 2015
include/triSYCL/vendor/Xilinx/acap/aie/layout/full.hpp
Layout for a AI Engine array with 5∗6 PE . . . 2063
include/triSYCL/vendor/Xilinx/acap/aie/layout/one_pe.hpp
Layout for a AI Engine array with 1 PE only . . . 2068
include/triSYCL/vendor/Xilinx/acap/aie/layout/size.hpp
Flexible layout for a AI Engine array with any 2D size . . . 2073
include/triSYCL/vendor/Xilinx/acap/aie/layout/small.hpp
Layout for a AI Engine array with a few PE only . . . 2078

Chapter 9

Module Documentation

9.1 AI Engine CGRA

Extensions to support explicit AI Engine system-wide programming in C++.

Collaboration diagram for AI Engine CGRA:

Namespaces

- namespace trisycl

  The vector type to be used as SYCL vector.
- namespace trisycl::vendor
- namespace trisycl::vendor::xilinx
- namespace trisycl::vendor::xilinx::acap
- namespace trisycl::vendor::xilinx::acap::aie
- namespace trisycl::vendor::xilinx::acap::aie::detail
- namespace trisycl::vendor::xilinx::acap::aie::layout

Classes

- class trisycl::vendor::xilinx::acap::aie::axi_stream_switch< AXIStreamGeography >

  An AXI stream switch parameterized with some geographic layout. More...
- struct trisycl::vendor::xilinx::acap::aie::cascade_stream< Geography >

  Implementation of the cascade stream infrastructure between AI Engine tiles. More...
- class trisycl::vendor::xilinx::acap::aie::axi_packet
- class trisycl::vendor::xilinx::acap::aie::dma_dsl< Tile, DMA, LockRef >

  Implement a small DSL to chain DMA & locking operations like allowed by the hardware. More...
- struct trisycl::vendor::xilinx::acap::aie::geography< Layout >

  Some geographic information about the AI Engine array. More...
- struct trisycl::vendor::xilinx::acap::aie::layout::full

  Describe the layout of a "big" AI Engine array. More...
- struct trisycl::vendor::xilinx::acap::aie::layout::one_pe

  Describe the layout of a tiny AI Engine with only 1 tile. More...
- struct trisycl::vendor::xilinx::acap::aie::layout::size< X_size, Y_size >

  Fully specify the size of an AI Engine layout. More...
- struct trisycl::vendor::xilinx::acap::aie::layout::small

  Describe the layout of a small AI Engine array with only a few PE. More...
- struct trisycl::vendor::xilinx::acap::aie::layout::ve1152
- struct trisycl::vendor::xilinx::acap::aie::lock_unit

  The lock infrastructure used by AI Engine memory modules and shim tiles. More...
- struct trisycl::vendor::xilinx::acap::aie::memory< AIE, X, Y >

  The AI Engine Memory Module infrastructure of a tile. More...
- struct trisycl::vendor::xilinx::acap::aie::memory_base

  The AI Engine Memory Module infrastructure of a tile common to all the tiles. More...
- class trisycl::vendor::xilinx::acap::aie::memory_infrastructure

  The AI Engine memory infrastructure common to all the tiles. More...
- struct trisycl::vendor::xilinx::acap::aie::program< AIEDevice, Tile, Memory >

  Define an AI Engine CGRA program with its code and memory per core. More...
- struct trisycl::vendor::xilinx::acap::aie::queue< AIEDevice >

  The AI Engine minimal queue. More...
- class trisycl::vendor::xilinx::acap::aie::shim_tile< AIEDevice >

  The AI Engine shim tile infrastructure. More...
- struct trisycl::vendor::xilinx::acap::aie::tile< AIE_Program, X, Y >

  The AI Engine tile infrastructure defining the program of a tile. More...
- class trisycl::vendor::xilinx::acap::aie::tile_base< AIE_Program >

  The AI Engine tile infrastructure common to all the tiles. More...
- class trisycl::vendor::xilinx::acap::aie::tile_infrastructure< Geography >

  The AI Engine tile infrastructure common to all the tiles. More...
- class trisycl::vendor::xilinx::acap::aie::detail::tile_infrastructure< Geography >

  The AI Engine tile infrastructure common to all the tiles. More...

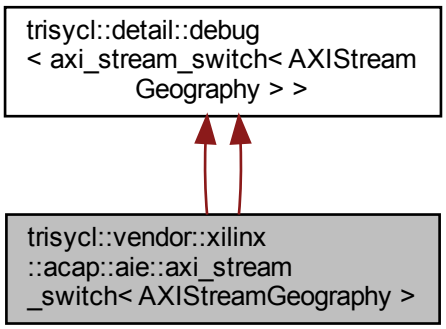
9.1.1 Detailed Description

Extensions to support explicit AI Engine system-wide programming in C++.

9.1.2 Class Documentation

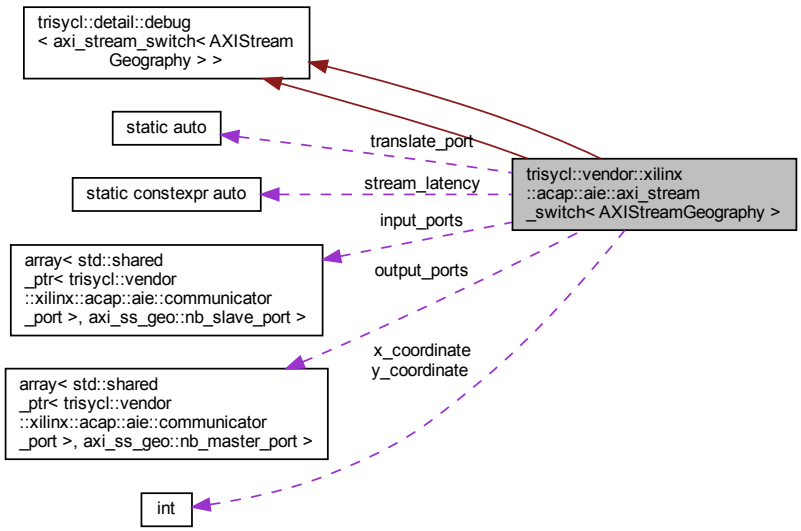
9.1.2.1 class trisycl::vendor::xilinx::acap::aie::axi_stream_switch

template<typename AXIStreamGeography>
class trisycl::vendor::xilinx::acap::aie::axi_stream_switch< AXIStreamGeography >



An AXI stream switch parameterized with some geographic layout.

Parameters



in	*AxiStreamGeography*	is the geography class used to instantiate the AXI stream switch.

Definition at line 51 of file axi_stream_switch.hpp.

Inheritance diagram for trisycl::vendor::xilinx::acap::aie::axi_stream_switch< AXIStreamGeography >:

Collaboration diagram for trisycl::vendor::xilinx::acap::aie::axi_stream_switch< AXIStreamGeography >:

Public Types

- using axi_ss_geo = AXIStreamGeography
- using mpl = typename axi_ss_geo::master_port_layout

Public Member Functions

- auto & in_connection (spl sp)

  Access the input connection behind an input port.
- auto & out_connection (mpl mp)

  Access the output connection behind an output port.
- void connect (spl sp, mpl mp)

  Configure a connection of the shim AXI stream switch.
- auto & input (spl p)

  Get the input router port of the AXI stream switch.
- auto & output (mpl p)

  Get the input router port of the AXI stream switch.
- axi_stream_switch ()

  Connect the internals of the AXI stream switch.
- void start (int x, int y, ::trisycl::detail::fiber_pool &fiber_executor)

  Start the tile infrastructure associated to the AIE device.
- int tikz_edge_angle (const std::string_view &port_name, const std::initializer_list< std::tuple< std::string_↩ view, int > > &desc) const

Compute the edge angle for a port name according a list of description associating a port name prefix and an associated angle in degree.

- void display_routing_configuration (latex::context &c) const

  Display the internal switch connections with routing arrows perpendicular to the borders.

- template<typename FG , typename FL , typename... EnumRanges>
  auto display_border (const std::string_view &node_attribute, FG &&global_coordinate_function, FL &&local↩
  _coordinate_function, EnumRanges &&... enum_ranges) const

  Display a border of the AXI stream switch.

- template<typename GTC >
  void display (latex::context &c, const vec< int, 2 > &core_size, const GTC &get_tikz_coordinate) const

  Display the AXI stream switch.

- auto & in_connection (spl sp)

  Access the input connection behind an input port.

- auto & out_connection (mpl mp)

  Access the output connection behind an output port.

- void connect (spl sp, mpl mp)

  Configure a connection of the shim AXI stream switch.

- auto & input (spl p)

  Get the input router port of the AXI stream switch.

- auto & output (mpl p)

  Get the input router port of the AXI stream switch.

- axi_stream_switch ()

  Connect the internals of the AXI stream switch.

- void start (int x, int y, ::trisycl::detail::fiber_pool &fiber_executor)

  Start the tile infrastructure associated to the AIE device.

- int tikz_edge_angle (const std::string_view &port_name, const std::initializer_list< std::tuple< std::string_↩
  view, int > > &desc) const

  Compute the edge angle for a port name according a list of description associating a port name prefix and an associated angle in degree.

- void display_routing_configuration (latex::context &c) const

  Display the internal switch connections with routing arrows perpendicular to the borders.

- template<typename FG , typename FL , typename... EnumRanges>
  auto display_border (const std::string_view &node_attribute, FG &&global_coordinate_function, FL &&local↩
  _coordinate_function, EnumRanges &&... enum_ranges) const

  Display a border of the AXI stream switch.

- template<typename GTC >
  void display (latex::context &c, const vec< int, 2 > &core_size, const GTC &get_tikz_coordinate) const

  Display the AXI stream switch.

Static Public Member Functions

- static router_minion * get_as_router_minion (communicator_port *rp)

  Get the router_minion behind a communicator_port.

- static vec< int, 2 > display_size ()

  Compute the size of the graphics representation of the switch.

- static router_minion * get_as_router_minion (communicator_port *rp)

  Get the router_minion behind a communicator_port.

- static vec< int, 2 > display_size ()

  Compute the size of the graphics representation of the switch.

Public Attributes

- std::array< std::shared_ptr< communicator_port >, axi_ss_geo::nb_slave_port > input_ports

  The input ports used to send information to the switch.
- std::array< std::shared_ptr< communicator_port >, axi_ss_geo::nb_master_port > output_ports

  The input ports used to send information to the switch.
- int x_coordinate

  Keep the horizontal coordinate for debug purpose.
- int y_coordinate

  Keep the vertical coordinate for debug purpose.

Static Public Attributes

- static auto translate_port

  Validate the user port number and translate it to the physical port number.
- static constexpr auto stream_latency = 4

00294     return input_ports[port];
00295   }
```

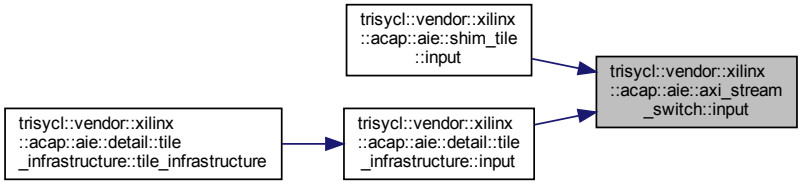
9.1.2.1.3.15 input() [1/2] template<typename AXIStreamGeography >

```
auto & trisycl::vendor::xilinx::acap::aie::axi_stream_switch< AXIStreamGeography >::input (
            spl p )  [inline]
```

Get the input router port of the AXI stream switch.

Parameters

p	is the slave_port_layout for the stream



Definition at line 373 of file axi_stream_switch.hpp.

```
00373                     {
00374     // No index validation required because of type safety
00375     return input_ports[::trisycl::detail::underlying_value(p)];
00376   }
```

References p, and trisycl::detail::underlying_value.

Referenced by trisycl::vendor::xilinx::acap::aie::shim_tile< AIEDevice >::input(), and trisycl::vendor::xilinx::acap::aie::detail::tile_infras

9.1.2.1.4 Member Data Documentation

9.1.2.1.4.1 input_ports template<typename AXIStreamGeography >

```
std::array< std::shared_ptr< communicator_port >, axi_ss_geo::nb_slave_port > trisycl::vendor::xilinx::acap:
AXIStreamGeography >::input_ports
```

The input ports used to send information to the switch.

Use a shared pointer to represent the interconnect between switches in a shortcut way.

Definition at line 352 of file axi_stream_switch.hpp.

9.1.2.1.4.2 output_ports template<typename AXIStreamGeography >

std::array< std::shared_ptr< communicator_port >, axi_ss_geo::nb_master_port > trisycl::vendor::xilinx::acap AXIStreamGeography >::output_ports

The input ports used to send information to the switch.

Use a shared pointer to represent the interconnect between switches in a shortcut way.

Definition at line 360 of file axi_stream_switch.hpp.

9.1.2.1.4.3 stream_latency template<typename AXIStreamGeography >

static constexpr auto trisycl::vendor::xilinx::acap::aie::axi_stream_switch< AXIStreamGeography >::stream_latency = 4 [static], [constexpr]

Definition at line 335 of file axi_stream_switch.hpp.

9.1.2.1.4.4 translate_port template<typename AXIStreamGeography >

static auto trisycl::vendor::xilinx::acap::aie::axi_stream_switch< AXIStreamGeography >↩ ::translate_port [inline], [static]

Initial value:

```
= [] (int user_port,
                                        auto physical_port_min,
                                        auto physical_port_max,
                                        const auto& error_message) {

    auto port_min = static_cast<int>(physical_port_min);
    auto port_max = static_cast<int>(physical_port_max);
    auto last_user_port = port_max - port_min;
    if (user_port < 0 || user_port > last_user_port)
      throw ::trisycl::runtime_error {
        (boost::format {
          "%1%:  %2% is not a valid port number between 0 and %3%" }
          % error_message % user_port % last_user_port).str() };

    return static_cast<decltype(physical_port_min)>(port_min + user_port);
  }
```

Validate the user port number and translate it to the physical port number.

Parameters

in	*user_port*	is the logical port number, starting to 0
in	*physical_port_min*	is the physical lower port number to map to
in	*physical_port_max*	is the physical higher port number to map to

Exceptions

trisycl::runtime_error	if the port number is invalid

Returns

the physical port number in the switch corresponding to the logical port

Todo This makes sense only for core tile

Collaboration diagram for trisycl::vendor::xilinx::acap::aie::cascade_stream< Geography >:

Public Types

- using geo = Geography
- using geo = Geography

Public Member Functions

- template<typename T >
  auto get_cascade_stream_in (int x, int y) const

  Get a blocking read accessor to the cascade stream input.
- template<typename T >
  auto get_cascade_stream_out (int x, int y) const

  Get a blocking write accessor to the cascade stream output.
- template<typename T >
  auto get_cascade_stream_in (int x, int y) const

  Get a blocking read accessor to the cascade stream input.
- template<typename T >
  auto get_cascade_stream_out (int x, int y) const

  Get a blocking write accessor to the cascade stream output.

Public Attributes

- ::trisycl::sycl_2_2::static_pipe< int, 4 > cascade_stream_pipes [geo::x_size *geo::y_size+1]

  The pipes for the cascade streams, with 1 spare pipe on each side of the PE string.

            int x,
            int y ) const  [inline]
```

Get a blocking read accessor to the cascade stream input.

Parameters

	T	is the data type used to read from the cascade stream pipe
in	x	is the horizontal tile coordinate
in	y	is the vertical tile coordinate

Definition at line 76 of file cascade_stream.hpp.

```
00076                                                {
00077     return cascade_stream_pipes[geo::cascade_linear_id(x, y)]
00078       .template get_access<access::mode::read,
00079                            access::target::blocking_pipe>();
00080   }
```

References trisycl::access::blocking_pipe, trisycl::vendor::xilinx::acap::aie::cascade_stream< Geography >::cascade_stream_pipes, trisycl::access::read, x, and trisycl::y.

9.1.2.2.2 get_cascade_stream_in() [2/2] template<typename Geography >

```
template<typename T >
auto trisycl::vendor::xilinx::acap::aie::cascade_stream< Geography >::get_cascade_stream_in (
             int x,
             int y ) const  [inline]
```

Get a blocking read accessor to the cascade stream input.

Parameters

	T	is the data type used to read from the cascade stream pipe
in	x	is the horizontal tile coordinate
in	y	is the vertical tile coordinate

Definition at line 76 of file cascade_stream.hpp.

```
00076                                                {
00077     return cascade_stream_pipes[geo::cascade_linear_id(x, y)]
00078       .template get_access<access::mode::read,
00079                            access::target::blocking_pipe>();
00080   }
```

References trisycl::access::blocking_pipe, trisycl::vendor::xilinx::acap::aie::cascade_stream< Geography >::cascade_stream_pipes, trisycl::access::read, x, and trisycl::y.

9.1.2.2.3 get_cascade_stream_out() [1/2] template<typename Geography >

```
template<typename T >
auto trisycl::vendor::xilinx::acap::aie::cascade_stream< Geography >::get_cascade_stream_out (
             int x,
             int y ) const  [inline]
```

Get a blocking write accessor to the cascade stream output.

Parameters

	T	is the data type used to write to the cascade stream pipe
in	x	is the horizontal tile coordinate
in	y	is the vertical tile coordinate

Definition at line 93 of file cascade_stream.hpp.

```
00093                                                {
00094     // The output is connected to the down-stream neighbour of the cascade
00095     return cascade_stream_pipes[geo::cascade_linear_id(x, y) + 1]
00096       .template get_access<access::mode::write,
00097                            access::target::blocking_pipe>();
00098   }
```

References trisycl::access::blocking_pipe, trisycl::vendor::xilinx::acap::aie::cascade_stream< Geography >::cascade_stream_pipes, trisycl::access::write, x, and trisycl::y.

9.1.2.2.4 get_cascade_stream_out() [2/2] template<typename Geography > template<typename T > auto trisycl::vendor::xilinx::acap::aie::cascade_stream< Geography >::get_cascade_stream_out (int x, int y) const [inline]

Get a blocking write accessor to the cascade stream output.

Parameters

	T	is the data type used to write to the cascade stream pipe
in	*x*	is the horizontal tile coordinate
in	*y*	is the vertical tile coordinate

Definition at line 93 of file cascade_stream.hpp.

```
00093                                                {
00094     // The output is connected to the down-stream neighbour of the cascade
00095     return cascade_stream_pipes[geo::cascade_linear_id(x, y) + 1]
00096       .template get_access<access::mode::write,
00097                            access::target::blocking_pipe>();
00098   }
```

References trisycl::access::blocking_pipe, trisycl::vendor::xilinx::acap::aie::cascade_stream< Geography >::cascade_stream_pipes, trisycl::access::write, x, and trisycl::y.

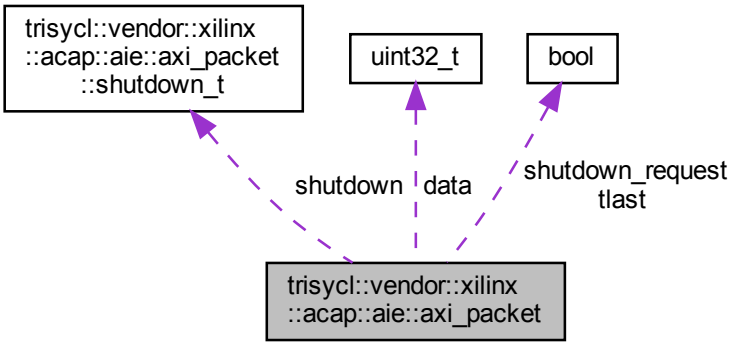
9.1.2.2.3.1 cascade_stream_pipes template<typename Geography > trisycl::sycl_2_2::static_pipe< int, 4 > trisycl::vendor::xilinx::acap::aie::cascade_stream< Geography >::cascade_stream_pipes

The pipes for the cascade streams, with 1 spare pipe on each side of the PE string.

Todo Use a data type with 384 bits

Todo Use a data type with 384 bits

Definition at line 54 of file cascade_stream.hpp.



Referenced by trisycl::vendor::xilinx::acap::aie::cascade_stream< Geography >::get_cascade_stream_in(), and trisycl::vendor::xilinx::acap::aie::cascade_stream< Geography >::get_cascade_stream_out().

9.1.2.3 class trisycl::vendor::xilinx::acap::aie::axi_packet

Packet moving in AIE network-on-chip (NoC)

Definition at line 31 of file connection.hpp.

Collaboration diagram for trisycl::vendor::xilinx::acap::aie::axi_packet:

Public Types

- using value_type = std::uint32_t

  Payload data type.
- using value_type = std::uint32_t

  Payload data type.

Public Member Functions

- axi_packet (const value_type &data)

  Implicit constructor from a data value.
- axi_packet (shutdown_t)

  Construct a shutdown request packet from axi_packet::shutdown.
- axi_packet ()=default
- axi_packet (const value_type &data)

  Implicit constructor from a data value.
- axi_packet (shutdown_t)

  Construct a shutdown request packet from axi_packet::shutdown.
- axi_packet ()=default

Public Attributes

- value_type data

  Network payload.
- bool tlast = false

  Signal end of packet stream.
- bool shutdown_request = false

  Signal a router shutdown.

Static Public Attributes

- static const shutdown_t shutdown

  Marker value used to construct a packet asking for shutdown.

9.1.2.3.3.2 shutdown static const shutdown_t trisycl::vendor::xilinx::acap::aie::axi_packet::shutdown [static]

Marker value used to construct a packet asking for shutdown.

Definition at line 41 of file connection.hpp.

Referenced by trisycl::vendor::xilinx::acap::aie::axi_stream_switch< AXIStreamGeography >::router_minion::~router_minion().

9.1.2.3.3.3 shutdown_request bool trisycl::vendor::xilinx::acap::aie::axi_packet::shutdown_request = false

Signal a router shutdown.

Definition at line 50 of file connection.hpp.

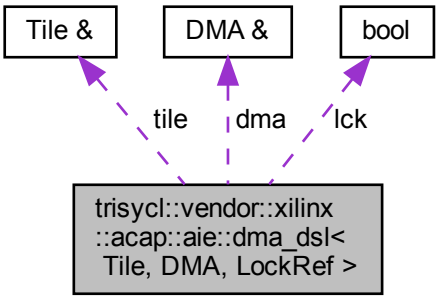
9.1.2.3.4 tlast `bool trisycl::vendor::xilinx::acap::aie::axi_packet::tlast = false`

Signal end of packet stream.

Definition at line 47 of file connection.hpp.

9.1.2.4 class trisycl::vendor::xilinx::acap::aie::dma_dsl

template<typename Tile, typename DMA, typename LockRef = bool>
class trisycl::vendor::xilinx::acap::aie::dma_dsl< Tile, DMA, LockRef >



Implement a small DSL to chain DMA & locking operations like allowed by the hardware.

Parameters

`in`	*Tile*	is the type of tile to keep a reference on it
`in`	*DMA*	is the type of the DMA involved in the operation
`in`	*LockRef*	is the type of the reference to the lock once a lock() operation is involved. Otherwise just use a `bool` as a dummy type internally.

Definition at line 46 of file dma.hpp.

Collaboration diagram for trisycl::vendor::xilinx::acap::aie::dma_dsl< Tile, DMA, LockRef >:

Public Member Functions

- dma_dsl (Tile &t, DMA &d)

  Keep track of operation with only DMA involved.
- dma_dsl (Tile &t, DMA &d, LockRef l)

  Keep track of operation with DMA and lock involved.
- auto lock (int l)

  Select a lock for the following operations.
- template<typename Cmd >
  auto & receive (Cmd &&cmd)

Enqueue a DMA receive command.

- template<typename Cmd >
  auto & send (Cmd &&cmd)

  Enqueue a DMA transfer command.
- auto & wait ()

  Wait for the transfers to complete.
- dma_dsl (Tile &t, DMA &d)

  Keep track of operation with only DMA involved.
- dma_dsl (Tile &t, DMA &d, LockRef l)

  Keep track of operation with DMA and lock involved.
- auto lock (int l)

  Select a lock for the following operations.
- template<typename Cmd >
  auto & receive (Cmd &&cmd)

  Enqueue a DMA receive command.
- template<typename Cmd >
  auto & send (Cmd &&cmd)

  Enqueue a DMA transfer command.
- auto & wait ()

  Wait for the transfers to complete.

Private Attributes

- Tile & tile

  Keep track of the tile involved in the operation chain.
- DMA & dma

  Keep track of the DMA involved in the operation chain.
- LockRef lck

  Keep track of the current lock involved in the operation chain if any.

9.1.2.4.1 Constructor & Destructor Documentation

9.1.2.4.1.1 dma_dsl() [1/4] template<typename Tile , typename DMA , typename LockRef = bool>

```
trisycl::vendor::xilinx::acap::aie::dma_dsl< Tile, DMA, LockRef >::dma_dsl (
            Tile & t,
            DMA & d )  [inline]
```

Keep track of operation with only DMA involved.

Definition at line 59 of file dma.hpp.

```
00060       :  tile { t }
00061       , dma { d } {}
```

9.1.2.4.2.3 receive() [1/2] template<typename Tile , typename DMA , typename LockRef = bool>

```
template<typename Cmd >
auto & trisycl::vendor::xilinx::acap::aie::dma_dsl< Tile, DMA, LockRef >::receive (
            Cmd && cmd )  [inline]
```

Enqueue a DMA receive command.

Definition at line 76 of file dma.hpp.

```
00076                                           {
00077     dma.receive(std::forward<Cmd>(cmd));
00078     // To be able to chain another DMA operation on it
00079     return *this;
00080   }
```

9.1.2.4.2.4 receive() [2/2]

```
template<typename Tile , typename DMA , typename LockRef = bool>
template<typename Cmd >
auto & trisycl::vendor::xilinx::acap::aie::dma_dsl< Tile, DMA, LockRef >::receive (
            Cmd && cmd )  [inline]
```

Enqueue a DMA receive command.

Definition at line 76 of file dma.hpp.

```
00076                                                {
00077     dma.receive(std::forward<Cmd>(cmd));
00078     // To be able to chain another DMA operation on it
00079     return *this;
00080   }
```

9.1.2.4.2.5 send() [1/2]

```
template<typename Tile , typename DMA , typename LockRef = bool>
template<typename Cmd >
auto & trisycl::vendor::xilinx::acap::aie::dma_dsl< Tile, DMA, LockRef >::send (
            Cmd && cmd )  [inline]
```

Enqueue a DMA transfer command.

Definition at line 83 of file dma.hpp.

```
00083                                                {
00084     dma.send(std::forward<Cmd>(cmd));
00085     // To be able to chain another DMA operation on it
00086     return *this;
00087   }
```

9.1.2.4.2.6 send() [2/2]

```
template<typename Tile , typename DMA , typename LockRef = bool>
template<typename Cmd >
auto & trisycl::vendor::xilinx::acap::aie::dma_dsl< Tile, DMA, LockRef >::send (
            Cmd && cmd )  [inline]
```

Enqueue a DMA transfer command.

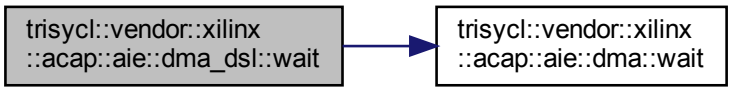
Definition at line 83 of file dma.hpp.

```
00083                                                {
00084     dma.send(std::forward<Cmd>(cmd));
00085     // To be able to chain another DMA operation on it
00086     return *this;
00087   }
```

9.1.2.4.2.7 wait() [1/2]

```
template<typename Tile , typename DMA , typename LockRef = bool>
auto & trisycl::vendor::xilinx::acap::aie::dma_dsl< Tile, DMA, LockRef >::wait ( )  [inline]
```

Wait for the transfers to complete.



The API assumes that the program is written in such a way that at some point the queue will be empty so there is no continuous DMA command enqueuing for example.

Definition at line 94 of file dma.hpp.

```
00094                {
00095     dma.wait();
00096     // To be able to chain another DMA operation on it
00097     return *this;
00098   }
```

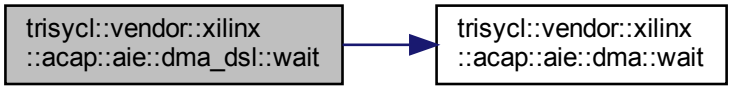
References trisycl::vendor::xilinx::acap::aie::dma< AXIStreamSwitch, SpecializedDMA >::wait().

Here is the call graph for this function:

9.1.2.4.2.8 wait() [2/2] template<typename Tile , typename DMA , typename LockRef = bool>

auto & trisycl::vendor::xilinx::acap::aie::dma_dsl< Tile, DMA, LockRef >::wait ( ) [inline]

Wait for the transfers to complete.



The API assumes that the program is written in such a way that at some point the queue will be empty so there is no continuous DMA command enqueuing for example.

Definition at line 94 of file dma.hpp.

```
00094               {
00095     dma.wait();
00096     // To be able to chain another DMA operation on it
00097     return *this;
00098   }
```

References trisycl::vendor::xilinx::acap::aie::dma< AXIStreamSwitch, SpecializedDMA >::wait().

Here is the call graph for this function:

9.1.2.4.3 Member Data Documentation

9.1.2.4.3.1 dma template<typename Tile , typename DMA , typename LockRef = bool>

DMA & trisycl::vendor::xilinx::acap::aie::dma_dsl< Tile, DMA, LockRef >::dma [private]

Keep track of the DMA involved in the operation chain.

Definition at line 51 of file dma.hpp.

Referenced by trisycl::vendor::xilinx::acap::aie::dma_dsl< Tile, DMA, LockRef >::lock().

9.1.2.4.3.2 lck `template<typename Tile , typename DMA , typename LockRef = bool>`

`LockRef trisycl::vendor::xilinx::acap::aie::dma_dsl< Tile, DMA, LockRef >::lck [private]`

Keep track of the current lock involved in the operation chain if any.

Definition at line 55 of file dma.hpp.

9.1.2.4.3.3 tile `template<typename Tile , typename DMA , typename LockRef = bool>`

`Tile & trisycl::vendor::xilinx::acap::aie::dma_dsl< Tile, DMA, LockRef >::tile [private]`

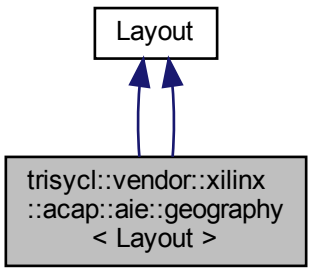
Keep track of the tile involved in the operation chain.

Definition at line 48 of file dma.hpp.

Referenced by trisycl::vendor::xilinx::acap::aie::dma_dsl< Tile, DMA, LockRef >::lock().

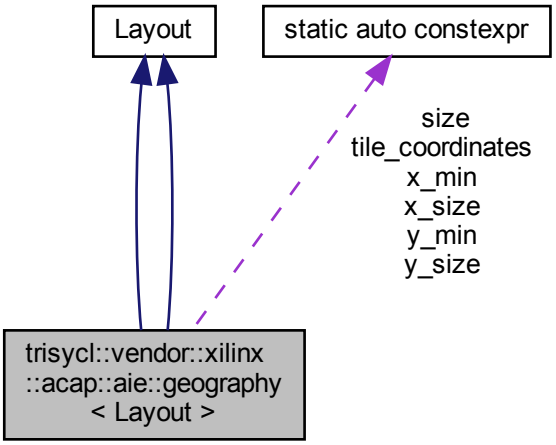
9.1.2.5 struct trisycl::vendor::xilinx::acap::aie::geography

template<typename Layout>
struct trisycl::vendor::xilinx::acap::aie::geography< Layout >



Some geographic information about the AI Engine array.

Parameters



Layout	is a class describing the basic layout of the CGRA, setting for example the x & y size

Definition at line 33 of file geography.hpp.

Inheritance diagram for trisycl::vendor::xilinx::acap::aie::geography< Layout >:

Collaboration diagram for trisycl::vendor::xilinx::acap::aie::geography< Layout >:

Public Types

- using layout = Layout

  Keep the layout used for this CGRA.
- using layout = Layout

  Keep the layout used for this CGRA.

Static Public Member Functions

- template<template< int X, int Y > typename Tileable>
  static auto generate_tiles ()

  Generate a tuple by tiling the Tileable object onto the CGRA geometry.
- static auto constexpr linear_id (int x, int y)

  Compute the linearized coordinate of a tile.
- static auto constexpr linear_x (int linear_id)

  Compute the horizontal coordinate of a tile from linear id.
- static auto constexpr linear_y (int linear_id)

  Compute the vertical coordinate of a tile from a linear id.
- static bool constexpr is_x_valid (int x)

  Test if an horizontal coordinate is valid.
- static void validate_x (int x)

  Validate an horizontal coordinate.
- static bool constexpr is_y_valid (int y)

  Test if a vertical coordinate is valid.
- static void validate_y (int y)

  Validate a vertical coordinate.
- static bool constexpr is_x_y_valid (int x, int y)

  Test if horizontal and vertical coordinates are valid.

- static void validate_x_y (int x, int y)

  Validate the horizontal and vertical coordinates.
- static bool constexpr is_west_column (int x)

  Test if a tile is in the Western column.
- static bool constexpr is_east_column (int x)

  Test if a tile is in the Eastern column.
- static bool constexpr is_south_row (int y)

  Test if a tile is in the Southern row.
- static bool constexpr is_north_row (int y)

  Test if a tile is in the Northern row.
- static bool constexpr is_cascade_start (int x, int y)

  Test if a tile owns the start of the cascade_stream.
- static bool constexpr is_cascade_end (int x, int y)

  Test if a tile owns the end of the cascade_stream.
- static auto constexpr cascade_linear_id (int x, int y)

  Compute the linearized coordinate of a tile along the cascade stream.
- static auto constexpr cascade_linear_x (int linear_id)

  Compute the horizontal coordinate of a tile from a cascade linear id.
- static auto constexpr cascade_linear_y (int linear_id)

  Compute the vertical coordinate of a tile from a cascade linear id.
- static bool constexpr is_valid_memory_module_offset (int dx, int dy)

  Test if a memory module coordinate offset is plausible.
- static bool constexpr is_memory_module (int x, int y, int dx, int dy)

  Test if a memory module exists and is connected to a tile.
- static auto constexpr memory_module_dx_coordinate (int y, int dx)

  Compute the memory module x coordinate delta from its tile.
- static auto constexpr memory_module_linear_id (int x, int y, int dx, int dy)

  Compute the linear id of a memory module attached to a tile.
- template<template< int X, int Y > typename Tileable>
  static auto generate_tiles ()

  Generate a tuple by tiling the Tileable object onto the CGRA geometry.
- static auto constexpr linear_id (int x, int y)

  Compute the linearized coordinate of a tile.
- static auto constexpr linear_x (int linear_id)

  Compute the horizontal coordinate of a tile from linear id.
- static auto constexpr linear_y (int linear_id)

  Compute the vertical coordinate of a tile from a linear id.
- static bool constexpr is_x_valid (int x)

  Test if an horizontal coordinate is valid.
- static void validate_x (int x)

  Validate an horizontal coordinate.
- static bool constexpr is_y_valid (int y)

  Test if a vertical coordinate is valid.
- static void validate_y (int y)

  Validate a vertical coordinate.
- static bool constexpr is_x_y_valid (int x, int y)

  Test if horizontal and vertical coordinates are valid.
- static void validate_x_y (int x, int y)

  Validate the horizontal and vertical coordinates.
- static bool constexpr is_west_column (int x)

  Test if a tile is in the Western column.

- static bool constexpr is_east_column (int x)

  Test if a tile is in the Eastern column.
- static bool constexpr is_south_row (int y)

  Test if a tile is in the Southern row.
- static bool constexpr is_north_row (int y)

  Test if a tile is in the Northern row.
- static bool constexpr is_cascade_start (int x, int y)

  Test if a tile owns the start of the cascade_stream.
- static bool constexpr is_cascade_end (int x, int y)

  Test if a tile owns the end of the cascade_stream.
- static auto constexpr cascade_linear_id (int x, int y)

  Compute the linearized coordinate of a tile along the cascade stream.
- static auto constexpr cascade_linear_x (int linear_id)

  Compute the horizontal coordinate of a tile from a cascade linear id.
- static auto constexpr cascade_linear_y (int linear_id)

  Compute the vertical coordinate of a tile from a cascade linear id.
- static bool constexpr is_valid_memory_module_offset (int dx, int dy)

  Test if a memory module coordinate offset is plausible.
- static bool constexpr is_memory_module (int x, int y, int dx, int dy)

  Test if a memory module exists and is connected to a tile.
- static auto constexpr memory_module_dx_coordinate (int y, int dx)

  Compute the memory module x coordinate delta from its tile.
- static auto constexpr memory_module_linear_id (int x, int y, int dx, int dy)

  Compute the linear id of a memory module attached to a tile.

Static Public Attributes

- static auto constexpr x_min = 0

  Minimum horizontal coordinate.
- static auto constexpr y_min = 0

  Minimum vertical coordinate.
- static auto constexpr x_size = layout::x_max + 1

  Number of tile horizontally in the CGRA.
- static auto constexpr y_size = layout::y_max + 1

  Number of tile vertically in the CGRA.
- static auto constexpr size = x_size∗y_size

  Total number of tiles in the CGRA.
- static auto constexpr tile_coordinates

  A tuple with the coordinate tuples of all the tiles inside the CGRA geometry.

9.1.2.5.1 Member Typedef Documentation

9.1.2.5.1.1 layout [1/2] template<typename Layout >

```
using trisycl::vendor::xilinx::acap::aie::geography< Layout >::layout = Layout
```

Keep the layout used for this CGRA.

Definition at line 35 of file geography.hpp.

9.1.2.5.1.2 layout [2/2] template<typename Layout >

```
using trisycl::vendor::xilinx::acap::aie::geography< Layout >::layout = Layout
```

Keep the layout used for this CGRA.

Definition at line 35 of file geography.hpp.

9.1.2.5.2 Member Function Documentation

9.1.2.5.2.1 cascade_linear_id() [1/2] template<typename Layout >

```
static auto constexpr trisycl::vendor::xilinx::acap::aie::geography< Layout >::cascade_↩
linear_id (
            int x,
            int y )  [inline], [static], [constexpr]
```

Compute the linearized coordinate of a tile along the cascade stream.

Parameters

in	*x*	is the horizontal tile coordinate
in	*y*	is the vertical tile coordinate

Definition at line 256 of file geography.hpp.

```
00256                                                    {
00257     return x_size*y + ((y & 1) ?  layout::x_max - x :  x);
00258   }
```

References x, trisycl::vendor::xilinx::acap::aie::geography< Layout >::x_size, and trisycl::y.

9.1.2.5.2.2 cascade_linear_id() [2/2] template<typename Layout >

```
static auto constexpr trisycl::vendor::xilinx::acap::aie::geography< Layout >::cascade_↩
linear_id (
            int x,
            int y )  [inline], [static], [constexpr]
```

Compute the linearized coordinate of a tile along the cascade stream.

Parameters

in	*x*	is the horizontal tile coordinate
in	*y*	is the vertical tile coordinate

Definition at line 256 of file geography.hpp.

```
00256                                                    {
00257     return x_size*y + ((y & 1) ?  layout::x_max - x :  x);
00258   }
```

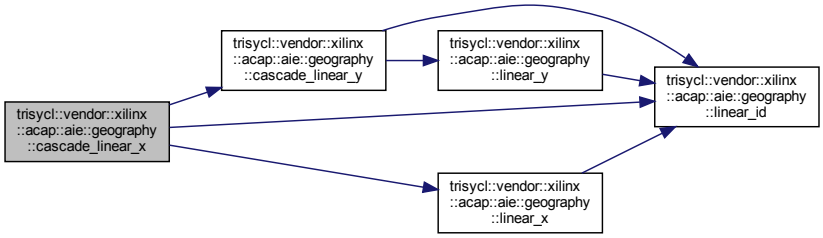
References x, trisycl::vendor::xilinx::acap::aie::geography< Layout >::x_size, and trisycl::y.

9.1.2.5.2.3 cascade_linear_x() [1/2] template<typename Layout >

```
static auto constexpr trisycl::vendor::xilinx::acap::aie::geography< Layout >::cascade_↩
linear_x (
            int linear_id )  [inline], [static], [constexpr]
```

Compute the horizontal coordinate of a tile from a cascade linear id.

Parameters



in	*linear↩ _id*	is a linear id along the cascade stream

Definition at line 266 of file geography.hpp.

```
00266                                                    {
00267     auto x = linear_x(linear_id);
00268     // According to the row parity, symmetrize the x coordinate
00269     return (cascade_linear_y(linear_id) & 1) ?  layout::x_max - x :  x;
00270   }
```

9.1.2.13.2.1 mi `std::optional< std::reference_wrapper< memory_infrastructure > > trisycl::vendor::xilinx::acap::aie::memory_base::mi`

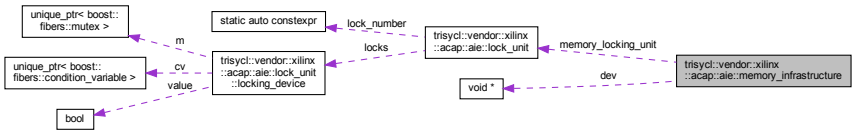
Keep a reference to the memory_infrastructure hardware features.

Definition at line 39 of file memory_base.hpp.

Referenced by lock(), and set_memory_infrastructure().

9.1.2.14 class trisycl::vendor::xilinx::acap::aie::memory_infrastructure

The AI Engine memory infrastructure common to all the tiles.



This allows some type erasure while accessing the common memory infrastructure.

Parameters

Geography	is the `geography` type representing the full layout of the architecture

Definition at line 33 of file memory_infrastructure.hpp.

Collaboration diagram for trisycl::vendor::xilinx::acap::aie::memory_infrastructure:

Public Member Functions

- memory_infrastructure (auto &dev)

  Start the memory infrastructure associated to the AIE device tile.
- auto & lock (int i)

  Get access to a specific lock in this memory module.
- memory_infrastructure (auto &dev)

  Start the memory infrastructure associated to the AIE device tile.
- auto & lock (int i)

  Get access to a specific lock in this memory module.

Private Attributes

- lock_unit memory_locking_unit

  The lock unit of the memory tile.
- void * dev

  Keep track of the aie::detail::device for hardware resource control in device mode or for debugging purpose for better messages.

9.1.2.14.1 Constructor & Destructor Documentation

9.1.2.14.1.1 memory_infrastructure() [1/2] trisycl::vendor::xilinx::acap::aie::memory_infrastructure↩ ::memory_infrastructure (auto & dev) [inline]

Start the memory infrastructure associated to the AIE device tile.

Parameters

in	*dev*	is the aie::detail::device used to control hardware when using real hardware and provide some debug information from inside the tile_infrastructure.

Use auto concept here to avoid explicit type causing circular dependency

Definition at line 55 of file memory_infrastructure.hpp.

```
00056       : dev { &dev } {}
```

9.1.2.14.1.2 memory_infrastructure() [2/2] trisycl::vendor::xilinx::acap::aie::memory_infrastructure↩ ::memory_infrastructure (auto & dev) [inline]

Start the memory infrastructure associated to the AIE device tile.

Parameters

in	*dev*	is the aie::detail::device used to control hardware when using real hardware and provide some debug information from inside the tile_infrastructure.

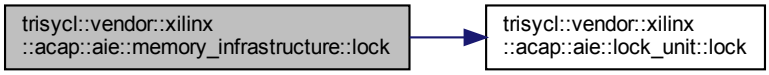
Use auto concept here to avoid explicit type causing circular dependency

Definition at line 55 of file memory_infrastructure.hpp.

```
00056       : dev { &dev } {}
```

9.1.2.14.2 Member Function Documentation

9.1.2.14.2.1 lock() [1/2] auto & trisycl::vendor::xilinx::acap::aie::memory_infrastructure::lock (int i) [inline]



Get access to a specific lock in this memory module.

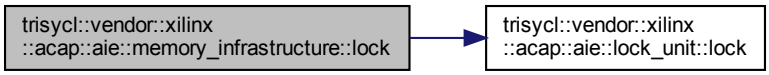
Definition at line 59 of file memory_infrastructure.hpp.

```
00059 { return memory_locking_unit.lock(i); }
```

References i, trisycl::vendor::xilinx::acap::aie::lock_unit::lock(), and memory_locking_unit.

Here is the call graph for this function:

9.1.2.14.2.2 lock() [2/2] auto & trisycl::vendor::xilinx::acap::aie::memory_infrastructure::lock (int *i*) [inline]



Get access to a specific lock in this memory module.

Definition at line 59 of file memory_infrastructure.hpp.

```
00059 { return memory_locking_unit.lock(i); }
```

References i, trisycl::vendor::xilinx::acap::aie::lock_unit::lock(), and memory_locking_unit.

Here is the call graph for this function:

9.1.2.14.3 Member Data Documentation

9.1.2.14.3.1 dev void * trisycl::vendor::xilinx::acap::aie::memory_infrastructure::dev [private]

Keep track of the aie::detail::device for hardware resource control in device mode or for debugging purpose for better messages.

Use void* for now to avoid cyclic header dependencies for now instead of the aie::detail::device

Definition at line 43 of file memory_infrastructure.hpp.

9.1.2.14.3.2 memory_locking_unit lock_unit trisycl::vendor::xilinx::acap::aie::memory_infrastructure::memory_locking_unit [private]

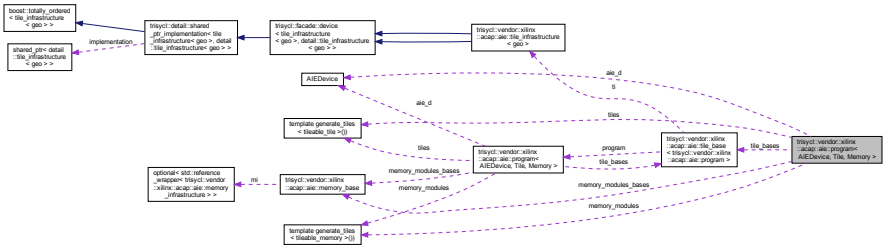
The lock unit of the memory tile.

Definition at line 35 of file memory_infrastructure.hpp.

Referenced by lock().

9.1.2.15 struct trisycl::vendor::xilinx::acap::aie::program

template<typename AIEDevice, template< typename AIE, int X, int Y > typename Tile = acap::aie::tile, template< typename AIE, int X, int Y > typename Memory = acap::aie::memory>
struct trisycl::vendor::xilinx::acap::aie::program< AIEDevice, Tile, Memory >



Define an AI Engine CGRA program with its code and memory per core.

Parameters

AIEDevice	is the device description of the machine to instantiate with the physical size
Tile	is the description of the program tiles to instantiate. By default each tile will run an empty program.
Memory	is the description of the machine memory modules. By default the machine has empty memory modules.

Definition at line 54 of file program.hpp.

Collaboration diagram for trisycl::vendor::xilinx::acap::aie::program< AIEDevice, Tile, Memory >:

Public Types

- using geo = typename AIEDevice::geo

  The geography of the CGRA.
- using device = AIEDevice
- template<int X, int Y>
  using tileable_memory = Memory< program, X, Y >

  Type describing all the memory modules of the CGRA.
- template<int X, int Y>
  using tileable_tile = Tile< program, X, Y >

  Type describing the programs of all the cores in the CGRA.
- using geo = typename AIEDevice::geo

  The geography of the CGRA.
- using device = AIEDevice
- template<int X, int Y>
  using tileable_memory = Memory< program, X, Y >

  Type describing all the memory modules of the CGRA.
- template<int X, int Y>
  using tileable_tile = Tile< program, X, Y >

  Type describing the programs of all the cores in the CGRA.

Public Member Functions

- memory_base & memory_module (int x, int y)

  Access to the common infrastructure part of a memory module.
- template<int LinearId>
  auto & memory_module ()

  Access to a heterogeneous memory module by its linear id.
- template<int X, int Y>
  auto & memory_module ()

  Access to a heterogeneous memory module by its coordinates.
- template<typename F >
  void for_each_memory_base (F &&f)

  Iterate on all the memory module bases of the AIE in an homogeneous way.
- template<int LinearId>
  auto & tile ()

  Access to a heterogeneous tile by linear id.
- template<int X, int Y>
  auto & tile ()

  Access to a heterogeneous tile by its coordinates.
- template<typename F >
  void for_each_tile_base (F &&f)

  Iterate on all the tile bases of the AIE in an homogeneous way.
- program (AIEDevice &aie_d)

  Create the AIE program with the tiles and memory modules.
- template<typename KernelName , typename KernelType >
  void kernel_outliner (KernelType k)

  Instantiate a kernel in a form that can be outlined by the SYCL device compiler.
- void wait ()

  Wait for the end of the execution of each tile.
- void run ()

  Launch the programs of all the tiles of the CGRA in their own executor (CPU thread, fiber...) and wait for their completion.
- template<typename Invocable >
  void run (Invocable &&f)

  Run synchronously an heterogeneous invocable collectively on the device.
- auto & cascade ()

  Access the cascade connections.
- memory_base & memory_module (int x, int y)

  Access to the common infrastructure part of a memory module.
- template<int LinearId>
  auto & memory_module ()

  Access to a heterogeneous memory module by its linear id.
- template<int X, int Y>
  auto & memory_module ()

  Access to a heterogeneous memory module by its coordinates.
- template<typename F >
  void for_each_memory_base (F &&f)

  Iterate on all the memory module bases of the AIE in an homogeneous way.
- template<int LinearId>
  auto & tile ()

  Access to a heterogeneous tile by linear id.
- template<int X, int Y>
  auto & tile ()

Access to a heterogeneous tile by its coordinates.

- template<typename F >
  void for_each_tile_base (F &&f)

  Iterate on all the tile bases of the AIE in an homogeneous way.
- program (AIEDevice &aie_d)

  Create the AIE program with the tiles and memory modules.
- template<typename KernelName , typename KernelType >
  void kernel_outliner (KernelType k)

  Instantiate a kernel in a form that can be outlined by the SYCL device compiler.
- void wait ()

  Wait for the end of the execution of each tile.
- void run ()

  Launch the programs of all the tiles of the CGRA in their own executor (CPU thread, fiber...) and wait for their completion.
- template<typename Invocable >
  void run (Invocable &&f)

  Run synchronously an heterogeneous invocable collectively on the device.
- auto & cascade ()

  Access the cascade connections.

Public Attributes

- AIEDevice aie_d

  The device running this program.
- decltype(geo::template generate_tiles< tileable_memory >()) memory_modules = geo::template generate_tiles<tileable_memory>()

  The tiled memory modules of the CGRA.
- memory_base * memory_modules_bases [geo::y_size][geo::x_size]

  Keep track of all the tiled memory modules as a type-erased memory_modules_base type to have a simpler access to the basic position-independent memory module features.
- decltype(geo::template generate_tiles< tileable_tile >()) tiles

  The tiled programs of the CGRA.
- tile_base< program > * tile_bases [geo::y_size][geo::x_size]

  Keep track of all the tiles as a type-erased tile_base type to have a simpler access to the basic position-independent tile features.

9.1.2.15.1 Member Typedef Documentation

9.1.2.15.1.1 device [1/2]

9.1.2.16.1 Member Typedef Documentation

9.1.2.16.1.1 device [1/2] template<typename AIEDevice >

```
using trisycl::vendor::xilinx::acap::aie::queue< AIEDevice >::device = AIEDevice
```

Definition at line 31 of file queue.hpp.

9.1.2.16.1.2 device [2/2] template<typename AIEDevice >

```
using trisycl::vendor::xilinx::acap::aie::queue< AIEDevice >::device = AIEDevice
```

Definition at line 31 of file queue.hpp.

9.1.2.16.1.3 geo [1/2] template<typename AIEDevice >

```
using trisycl::vendor::xilinx::acap::aie::queue< AIEDevice >::geo = typename device::geo
```

Definition at line 32 of file queue.hpp.

9.1.2.16.1.4 geo [2/2] template<typename AIEDevice >

```
using trisycl::vendor::xilinx::acap::aie::queue< AIEDevice >::geo = typename device::geo
```

Definition at line 32 of file queue.hpp.

9.1.2.16.1.5 layout [1/2] template<typename AIEDevice >

```
using trisycl::vendor::xilinx::acap::aie::queue< AIEDevice >::layout = typename geo::layout
```

Definition at line 33 of file queue.hpp.

9.1.2.16.1.6 layout [2/2] template<typename AIEDevice >

```
using trisycl::vendor::xilinx::acap::aie::queue< AIEDevice >::layout = typename geo::layout
```

Definition at line 33 of file queue.hpp.

9.1.2.16.2 Constructor & Destructor Documentation

9.1.2.16.2.1 queue() [1/2] template<typename AIEDevice >

```
trisycl::vendor::xilinx::acap::aie::queue< AIEDevice >::queue (
            device & d )  [inline]
```

Definition at line 38 of file queue.hpp.

```
00039       :  aie_d { d } {}
```

9.1.2.16.2.2 queue() [2/2] template<typename AIEDevice >

```
trisycl::vendor::xilinx::acap::aie::queue< AIEDevice >::queue (
            device & d )  [inline]
```

Definition at line 38 of file queue.hpp.

```
00039       :  aie_d { d } {}
```

9.1.2.16.3 Member Function Documentation

9.1.2.16.3.1 run() [1/4] template<typename AIEDevice >

```
template<template< typename Device, int X, int Y > typename Tile = acap::aie::tile, template<
typename Device, int X, int Y > typename Memory = acap::aie::memory>
void trisycl::vendor::xilinx::acap::aie::queue< AIEDevice >::run ( ) const  [inline]
```

Run synchronously a program execution on this queue.

Parameters

Tile	is the description of the program tiles to instantiate. By default each tile will run an empty program.
Memory	is the description of the machine memory modules. By default the machine has empty memory modules.

Definition at line 63 of file queue.hpp.

```
00063                   {
00064     program<device, Tile, Memory> { aie_d }.run();
00065   }
```

References trisycl::vendor::xilinx::acap::aie::queue< AIEDevice >::aie_d.

9.1.2.16.3.2 run() [2/4] template<typename AIEDevice >

```
template<template< typename Device, int X, int Y > typename Tile = acap::aie::tile, template<
typename Device, int X, int Y > typename Memory = acap::aie::memory>
void trisycl::vendor::xilinx::acap::aie::queue< AIEDevice >::run ( ) const  [inline]
```

Run synchronously a program execution on this queue.

Parameters

Tile	is the description of the program tiles to instantiate. By default each tile will run an empty program.
Memory	is the description of the machine memory modules. By default the machine has empty memory modules.

Definition at line 63 of file queue.hpp.

```
00063                     {
00064     program<device, Tile, Memory> { aie_d }.run();
00065   }
```

References trisycl::vendor::xilinx::acap::aie::queue< AIEDevice >::aie_d.

9.1.2.16.3.3 run() [3/4] template<typename AIEDevice >

```
template<typename Invocable >
void trisycl::vendor::xilinx::acap::aie::queue< AIEDevice >::run (
             Invocable && f ) const  [inline]
```

Run synchronously an heterogeneous invocable on this queue.

Parameters

f	is an invocable taking an heterogeneous tile handler

Definition at line 71 of file queue.hpp.

```
00071                                                          {
00072     program<device> { aie_d }.run(std::forward<Invocable>(f));
00073   }
```

References trisycl::vendor::xilinx::acap::aie::queue< AIEDevice >::aie_d.

9.1.2.16.3.4 run() [4/4] template<typename AIEDevice >

```
template<typename Invocable >
void trisycl::vendor::xilinx::acap::aie::queue< AIEDevice >::run (
             Invocable && f ) const  [inline]
```

Run synchronously an heterogeneous invocable on this queue.

Parameters

f	is an invocable taking an heterogeneous tile handler

Definition at line 71 of file queue.hpp.

```
00071                                                                 {
00072     program<device> { aie_d }.run(std::forward<Invocable>(f));
00073   }
```

References trisycl::vendor::xilinx::acap::aie::queue< AIEDevice >::aie_d.

9.1.2.16.3.5 submit() [1/2] template<typename AIEDevice >

```
template<template< typename Device, int X, int Y > typename Tile = acap::aie::tile, template<
typename Device, int X, int Y > typename Memory = acap::aie::memory>
auto trisycl::vendor::xilinx::acap::aie::queue< AIEDevice >::submit ( ) const  [inline]
```

Submit a program execution on this queue.

Todo SUBMIT

Parameters

Tile	is the description of the program tiles to instantiate. By default each tile will run an empty program.
Memory	is the description of the machine memory modules. By default the machine has empty memory modules.

\fixme implement a real queue with lifetime support because here it assume the device will last...

Definition at line 106 of file queue.hpp.

```
00106                     {
00107     return queue_waiter { std::async(std::launch::async,
00108 /** \fixme implement a real queue with
00109 lifetime support because here it assume
00110 the device will last...  */
00111                                      [*this] { this->run<Tile, Memory>(); }) };
00112   }
```

9.1.2.16.3.6 submit() [2/2] template<typename AIEDevice >

```
template<template< typename Device, int X, int Y > typename Tile = acap::aie::tile, template<
typename Device, int X, int Y > typename Memory = acap::aie::memory>
auto trisycl::vendor::xilinx::acap::aie::queue< AIEDevice >::submit ( ) const  [inline]
```

Submit a program execution on this queue.

Todo SUBMIT

Parameters

Tile	is the description of the program tiles to instantiate. By default each tile will run an empty program.
Memory	is the description of the machine memory modules. By default the machine has empty memory modules.

\fixme implement a real queue with lifetime support because here it assume the device will last...

Definition at line 106 of file queue.hpp.

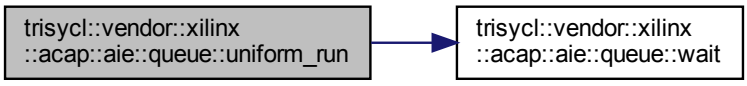
```
00106                       {
00107     return queue_waiter { std::async(std::launch::async,
00108 /** \fixme implement a real queue with
00109 lifetime support because here it assume
00110 the device will last...  */
00111                                      [*this] { this->run<Tile, Memory>(); }) };
00112   }
```

9.1.2.16.3.7 uniform_run() [1/2] template<typename AIEDevice >

```
template<typename Invocable >
void trisycl::vendor::xilinx::acap::aie::queue< AIEDevice >::uniform_run (
             Invocable && f ) const  [inline]
```

Run synchronously a uniform invocable on this queue.

Parameters



f	is an invocable taking a uniform tile handler

Definition at line 84 of file queue.hpp.

```
00084                                                                    {
00085     aie_d.for_each_tile(
00086         [work = std::forward<Invocable>(f)](auto& t) {
00087           t.single_task(work);
00088         });
00089     wait();
00090   }
```

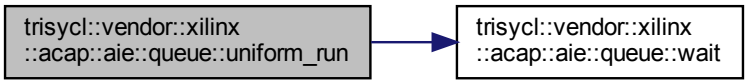
Here is the call graph for this function:

9.1.2.16.3.8 uniform_run() [2/2] template<typename AIEDevice >

```
template<typename Invocable >
void trisycl::vendor::xilinx::acap::aie::queue< AIEDevice >::uniform_run (
             Invocable && f ) const  [inline]
```

Run synchronously a uniform invocable on this queue.

Parameters



f	is an invocable taking a uniform tile handler

Definition at line 84 of file queue.hpp.

```
00084                                                                    {
00085     aie_d.for_each_tile(
00086         [work = std::forward<Invocable>(f)](auto& t) {
00087           t.single_task(work);
00088         });
00089     wait();
00090   }
```

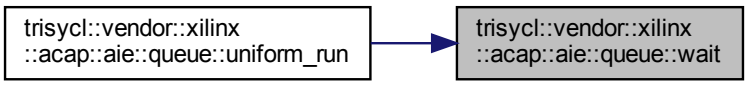
References trisycl::vendor::xilinx::acap::aie::queue< AIEDevice >::aie_d, and trisycl::vendor::xilinx::acap::aie::queue< AIEDevice >::

Here is the call graph for this function:

9.1.2.16.3.9 wait() [1/2] template<typename AIEDevice >

```
void trisycl::vendor::xilinx::acap::aie::queue< AIEDevice >::wait ( ) const  [inline]
```

Wait for all the device tiles on this queue to finish.



Definition at line 76 of file queue.hpp.

```
00076                     {
00077     aie_d.for_each_tile([](auto& t) { t.wait(); });
00078   }
```

References trisycl::vendor::xilinx::acap::aie::queue< AIEDevice >::aie_d.

Referenced by trisycl::vendor::xilinx::acap::aie::queue< AIEDevice >::uniform_run().

Here is the caller graph for this function:

9.1.2.16.3.10 wait() [2/2] template<typename AIEDevice >

void trisycl::vendor::xilinx::acap::aie::queue< AIEDevice >::wait ( ) const [inline]

Wait for all the device tiles on this queue to finish.

Definition at line 76 of file queue.hpp.

```
00076                   {
00077     aie_d.for_each_tile([](auto& t) { t.wait(); });
00078   }
```

References trisycl::vendor::xilinx::acap::aie::queue< AIEDevice >::aie_d.

9.1.2.16.4 Member Data Documentation

9.1.2.16.4.1 aie_d template<typename AIEDevice >

device& trisycl::vendor::xilinx::acap::aie::queue< AIEDevice >::aie_d

Todo Why using a reference since now a device is a shared_ptr?

Todo Why using a reference since now a device is a shared_ptr?

Definition at line 36 of file queue.hpp.

Referenced by trisycl::vendor::xilinx::acap::aie::queue< AIEDevice >::run(), trisycl::vendor::xilinx::acap::aie::queue< AIEDevice >::u and trisycl::vendor::xilinx::acap::aie::queue< AIEDevice >::wait().

9.1.2.17 class trisycl::vendor::xilinx::acap::aie::shim_tile

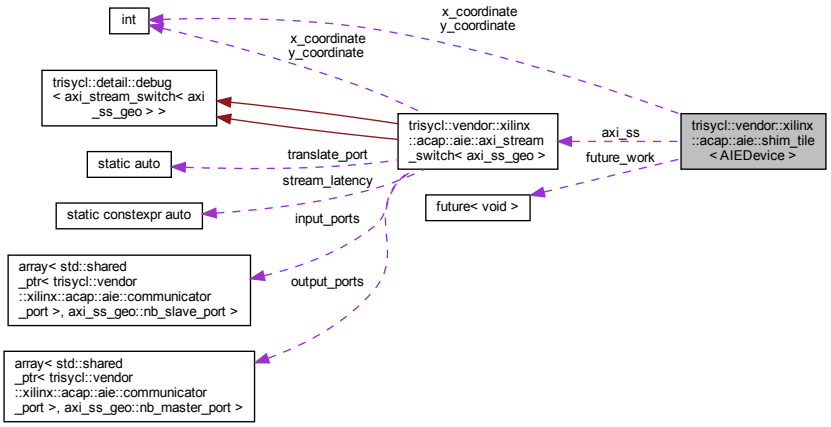
template<typename AIEDevice>
class trisycl::vendor::xilinx::acap::aie::shim_tile< AIEDevice >

The AI Engine shim tile infrastructure.

Parameters

AIE	is the type representing the full CGRA with the programs and memory contents

Todo Assume only AIE Shim PL tiles for now



Parameters

AIE	is the type representing the full CGRA with the programs and memory contents

Todo Assume only AIE Shim PL tiles for now

Definition at line 32 of file shim_tile.hpp.

Collaboration diagram for trisycl::vendor::xilinx::acap::aie::shim_tile< AIEDevice >:

Public Member Functions

- shim_tile ()

  Construct the shim tile infrastructure.
- void start (int x, ::trisycl::detail::fiber_pool &fiber_executor)

  Start the shim tile infrastructure associated to the AIE device.
- auto & input (spl p)

  Get the input router port of the AXI stream switch.
- auto & output (mpl p)

  Get the output router port of the AXI stream switch.
- auto & bli_in_connection (int port)

  Get the BLI input connection from the shim tile.
- auto & bli_out_connection (int port)

  Get the BLI output connection to the shim tile.
- auto & bli_in (int port)

  Get the BLI (Boundary Logic Interface) input port from the PL (Programmable Logic in the FPGA) to read data from.
- auto & bli_out (int port)

  Get the BLI (Boundary Logic Interface) output port to the PL (Programmable Logic in the FPGA) to write data to.
- void connect (typename geo::shim_axi_stream_switch::slave_port_layout sp, typename geo::shim_axi_↩ stream_switch::master_port_layout mp)

  Configure a connection of the shim tile AXI stream switch.
- shim_tile ()

  Construct the shim tile infrastructure.
- void start (int x, ::trisycl::detail::fiber_pool &fiber_executor)

  Start the shim tile infrastructure associated to the AIE device.
- auto & input (spl p)

  Get the input router port of the AXI stream switch.
- auto & output (mpl p)

  Get the output router port of the AXI stream switch.
- auto & bli_in_connection (int port)

  Get the BLI input connection from the shim tile.
- auto & bli_out_connection (int port)

Get the BLI output connection to the shim tile.

- auto & bli_in (int port)

  Get the BLI (Boundary Logic Interface) input port from the PL (Programmable Logic in the FPGA) to read data from.
- auto & bli_out (int port)

  Get the BLI (Boundary Logic Interface) output port to the PL (Programmable Logic in the FPGA) to write data to.
- void connect (typename geo::shim_axi_stream_switch::slave_port_layout sp, typename geo::shim_axi_↩ stream_switch::master_port_layout mp)

  Configure a connection of the shim tile AXI stream switch.

Static Public Member Functions

- static auto translate_input_port (int port)

  Map the input BLI id/port to the shim AXI stream switch port.
- static auto translate_output_port (int port)

  Map the input BLI id/port to the shim AXI stream switch port.
- static auto translate_input_port (int port)

  Map the input BLI id/port to the shim AXI stream switch port.
- static auto translate_output_port (int port)

  Map the input BLI id/port to the shim AXI stream switch port.

Private Types

- using geo = typename AIEDevice::geo
- using axi_ss_geo = typename geo::shim_axi_stream_switch
- using mpl = typename axi_ss_geo::master_port_layout
- using spl = typename axi_ss_geo::slave_port_layout
- using axi_ss_t = axi_stream_switch< axi_ss_geo >
- using geo = typename AIEDevice::geo
- using axi_ss_geo = typename geo::shim_axi_stream_switch
- using mpl = typename axi_ss_geo::master_port_layout
- using spl = typename axi_ss_geo::slave_port_layout
- using axi_ss_t = axi_stream_switch< axi_ss_geo >

Private Attributes

- int x_coordinate

  Keep the horizontal coordinate for debug purpose.
- int y_coordinate = -1
- axi_ss_t axi_ss

  The AXI stream switch of the core tile.
- std::future< void > future_work

  Keep track of the std::thread execution in this tile.

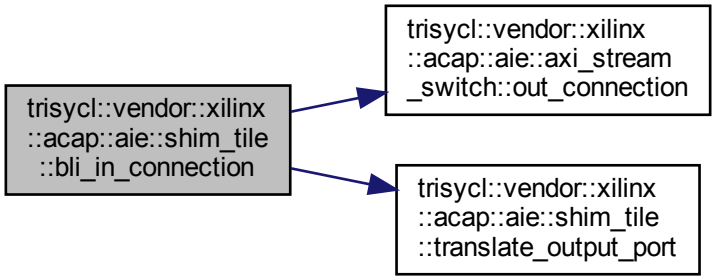
9.1.2.17.3.3 bli_in_connection() [1/2] template<typename AIEDevice >

```
auto & trisycl::vendor::xilinx::acap::aie::shim_tile< AIEDevice >::bli_in_connection (
            int port )  [inline]
```

Get the BLI input connection from the shim tile.

Parameters

in	*port*	is the BLI id/port to use



Definition at line 133 of file shim_tile.hpp.

```
00133                                       {
00134     // The input is actually the output of the switch
00135     return axi_ss.out_connection(translate_output_port(port));
00136   }
```

Referenced by trisycl::vendor::xilinx::acap::aie::shim_tile< AIEDevice >::start().

9.1.2.17.4.4 y_coordinate template<typename AIEDevice >

int trisycl::vendor::xilinx::acap::aie::shim_tile< AIEDevice >::y_coordinate = -1 [private]

Todo Remove? Keep the vertical coordinate for debug purpose

Todo Remove? Keep the vertical coordinate for debug purpose

Definition at line 44 of file shim_tile.hpp.

9.1.2.18 struct trisycl::vendor::xilinx::acap::aie::tile

template<typename AIE_Program, int X, int Y>
struct trisycl::vendor::xilinx::acap::aie::tile< AIE_Program, X, Y >

The AI Engine tile infrastructure defining the program of a tile.

This is the type you need to inherit from to define the program of a CGRA tile.

Parameters

AIE_Program	is the type representing the full CGRA with the programs and memory contents
X	is the horizontal coordinate of the memory module
Y	is the vertical coordinate of the memory module

Todo (Andrew Gozillon) FYI, until Intel fix the way they handle base classes in the SYCL compiler frontend this tile_base can never have non-default constructed data (on the device side implementation, the host should be fine to have whatever). As the hack I have in place just now only outlines a call to the base classes default constructor, it might be feasible to work around that though by calling a base class "fill" function in the tile constructor or tweaking the way the run function of a tile is outlined so that it outlines it as a copy of the full object rather than components of the object and reconstructing it inside the kernel (although you'll fall into the standard layout trap as you'll be passing a full object to the kernel invocation and it'd take some reworking of the Tile's main generation).

A proper fix for this is probably quite difficult as you'd need to take into account the base classes dependencies among-st other things like the constructor body not being available in the same TU, some discussion here: https://github.com/intel/llvm/issues/488

This is the type you need to inherit from to define the program of a CGRA tile.

Inheritance diagram for trisycl::vendor::xilinx::acap::aie::tile< AIE_Program, X, Y >:

Collaboration diagram for trisycl::vendor::xilinx::acap::aie::tile< AIE_Program, X, Y >:

Public Types

- using geo = typename AIE_Program::geo

  The geography of the CGRA.
- using tb = tile_base< AIE_Program >

  Shortcut to the tile base class.
- using mem_t = typename AIE_Program::template tileable_memory< x, y >

  The type of the memory module native to the tile.
- using geo = typename AIE_Program::geo

  The geography of the CGRA.
- using tb = tile_base< AIE_Program >

  Shortcut to the tile base class.
- using mem_t = typename AIE_Program::template tileable_memory< x, y >

  The type of the memory module native to the tile.

Public Member Functions

- auto & mem_west ()

  Get the memory module on the West if it does exist.
- auto & mem_east ()

  Get the memory module on the East if it does exist.
- auto & mem_south ()

  Get the memory module on the South if it does exist.

- auto & mem_north ()

  Get the memory module on the North if it does exist.
- auto & mem ()

  The memory module native to the tile.
- template<int Dx, int Dy>
  auto & mem ()

  Get the memory module relative to the tile.
- template<typename T >
  auto get_cascade_stream_in ()

  Get a read accessor to the cascade stream input.
- template<typename T >
  auto get_cascade_stream_out ()

  Get a write accessor to the cascade stream output.
- void horizontal_barrier (int lock=14)

  An horizontal barrier using a lock.
- void vertical_barrier (int lock=15)

  A vertical barrier using a lock.
- void barrier ()

  Full barrier using the 2 locks by default.
- auto rx_dma (int port)

  Get access on a receiver DMA.
- auto tx_dma (int port)

  Get access on a transmit DMA.
- auto & mem_west ()

  Get the memory module on the West if it does exist.
- auto & mem_east ()

  Get the memory module on the East if it does exist.
- auto & mem_south ()

  Get the memory module on the South if it does exist.
- auto & mem_north ()

  Get the memory module on the North if it does exist.
- auto & mem ()

  The memory module native to the tile.
- template<int Dx, int Dy>
  auto & mem ()

  Get the memory module relative to the tile.
- template<typename T >
  auto get_cascade_stream_in ()

  Get a read accessor to the cascade stream input.
- template<typename T >
  auto get_cascade_stream_out ()

  Get a write accessor to the cascade stream output.
- void horizontal_barrier (int lock=14)

  An horizontal barrier using a lock.
- void vertical_barrier (int lock=15)

  A vertical barrier using a lock.
- void barrier ()

  Full barrier using the 2 locks by default.
- auto rx_dma (int port)

  Get access on a receiver DMA.
- auto tx_dma (int port)

  Get access on a transmit DMA.

Static Public Member Functions

- template<int Dim>
  static auto constexpr get_id ()

  Return the coordinate of the tile in the given dimension.
- static auto constexpr linear_id ()

  Return the linearized coordinate of the tile.
- static bool constexpr is_west_column ()

  Test if the tile is in the Western column.
- static bool constexpr is_east_column ()

  Test if the tile is in the Eastern column.
- static bool constexpr is_south_row ()

  Test if the tile is in the Southern row.
- static bool constexpr is_north_row ()

  Test if the tile is in the Northern row.
- static bool constexpr is_west_valid ()

  Test if the tile has a Western neighbor.
- static bool constexpr is_east_valid ()

  Test if the tile has a Eastern neighbor.
- static bool constexpr is_south_valid ()

  Test if the tile has a Southern neighbor.
- static bool constexpr is_south_west_valid ()

  Test if the tile has a South West neighbor.
- static bool constexpr is_south_east_valid ()

  Test if the tile has a South East neighbor.
- static bool constexpr is_north_valid ()

  Test if the tile has a Northern neighbor.
- static bool constexpr is_north_east_valid ()

  Test if the tile has a North East neighbor.
- static bool constexpr is_north_west_valid ()

  Test if the tile has a North West neighbor.
- static bool constexpr is_memory_module (int dx, int dy)

  Test if a memory module exists and is connected to this tile.
- static bool constexpr is_memory_module_west ()

  Test if a memory module exists on the West of this tile.
- static bool constexpr is_memory_module_east ()

  Test if a memory module exists on the East of this tile.
- static bool constexpr is_memory_module_south ()

  Test if a memory module exists on the South this tile.
- static bool constexpr is_memory_module_north ()

  Test if a memory module exists on the North this tile.
- static auto constexpr memory_module_linear_id (int dx, int dy)

  Compute the linear id of a memory module attached to this tile.
- static bool constexpr is_cascade_start ()

  Test if this tile owns the start of the cascade_stream.
- static bool constexpr is_cascade_end ()

  Test if this tile owns the end of the cascade_stream.
- static auto constexpr cascade_linear_id ()

  Compute the linearized coordinate of a tile along the cascade stream.
- template<int Dim>
  static auto constexpr get_id ()

Return the coordinate of the tile in the given dimension.

- static auto constexpr linear_id ()

  Return the linearized coordinate of the tile.
- static bool constexpr is_west_column ()

  Test if the tile is in the Western column.
- static bool constexpr is_east_column ()

  Test if the tile is in the Eastern column.
- static bool constexpr is_south_row ()

  Test if the tile is in the Southern row.
- static bool constexpr is_north_row ()

  Test if the tile is in the Northern row.
- static bool constexpr is_west_valid ()

  Test if the tile has a Western neighbor.
- static bool constexpr is_east_valid ()

  Test if the tile has a Eastern neighbor.
- static bool constexpr is_south_valid ()

  Test if the tile has a Southern neighbor.
- static bool constexpr is_south_west_valid ()

  Test if the tile has a South West neighbor.
- static bool constexpr is_south_east_valid ()

  Test if the tile has a South East neighbor.
- static bool constexpr is_north_valid ()

  Test if the tile has a Northern neighbor.
- static bool constexpr is_north_east_valid ()

  Test if the tile has a North East neighbor.
- static bool constexpr is_north_west_valid ()

  Test if the tile has a North West neighbor.
- static bool constexpr is_memory_module (int dx, int dy)

  Test if a memory module exists and is connected to this tile.
- static bool constexpr is_memory_module_west ()

  Test if a memory module exists on the West of this tile.
- static bool constexpr is_memory_module_east ()

  Test if a memory module exists on the East of this tile.
- static bool constexpr is_memory_module_south ()

  Test if a memory module exists on the South this tile.
- static bool constexpr is_memory_module_north ()

  Test if a memory module exists on the North this tile.
- static auto constexpr memory_module_linear_id (int dx, int dy)

  Compute the linear id of a memory module attached to this tile.
- static bool constexpr is_cascade_start ()

  Test if this tile owns the start of the cascade_stream.
- static bool constexpr is_cascade_end ()

  Test if this tile owns the end of the cascade_stream.
- static auto constexpr cascade_linear_id ()

  Compute the linearized coordinate of a tile along the cascade stream.

Static Public Attributes

- static auto constexpr x = X

  The horizontal tile coordinates in the CGRA grid (starting at 0 and increasing towards the East)
- static auto constexpr y = Y

  The vertical tile coordinates in the CGRA grid (starting at increasing towards the North)

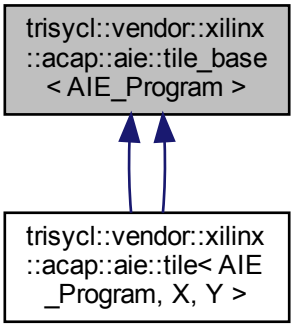
9.1.2.19 class trisycl::vendor::xilinx::acap::aie::tile_base

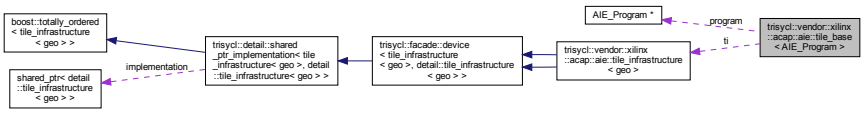
template<typename AIE_Program>
class trisycl::vendor::xilinx::acap::aie::tile_base< AIE_Program >

The AI Engine tile infrastructure common to all the tiles.



This allows some type erasure while accessing the common tile infrastructure.

Parameters



AIE_Program	is the type representing the full CGRA program with the tile programs and memory contents

Definition at line 32 of file tile_base.hpp.

Inheritance diagram for trisycl::vendor::xilinx::acap::aie::tile_base< AIE_Program >:

Collaboration diagram for trisycl::vendor::xilinx::acap::aie::tile_base< AIE_Program >:

Public Member Functions

- void run ()

  Provide a run member function that does nothing so it is possible to write a minimum AI Engine program that does nothing.

- template<typename Work >
  void single_task (Work &&f)

  Submit a callable on this tile.

- void wait ()

  Wait for the execution of the callable on this tile.
- auto & cascade ()

  Access the cascade connections.
- auto & in_connection (int port)

  Get the user input connection from the AXI stream switch.
- auto & out_connection (int port)

  Get the user output connection to the AXI stream switch.
- auto & in (int port)

  Get the user input port from the AXI stream switch.
- auto & out (int port)

  Get the user output port to the AXI stream switch.
- void set_program (AIE_Program &p)

  Store a way to access to the program.
- void set_tile_infrastructure (tile_infrastructure< geo > t)

  Store a way to access to hardware infrastructure of the tile.
- void run ()

  Provide a run member function that does nothing so it is possible to write a minimum AI Engine program that does nothing.
- template<typename Work >
  void single_task (Work &&f)

  Submit a callable on this tile.
- void wait ()

  Wait for the execution of the callable on this tile.
- auto & cascade ()

  Access the cascade connections.
- auto & in_connection (int port)

  Get the user input connection from the AXI stream switch.
- auto & out_connection (int port)

  Get the user output connection to the AXI stream switch.
- auto & in (int port)

  Get the user input port from the AXI stream switch.
- auto & out (int port)

  Get the user output port to the AXI stream switch.
- void set_program (AIE_Program &p)

  Store a way to access to the program.
- void set_tile_infrastructure (tile_infrastructure< geo > t)

  Store a way to access to hardware infrastructure of the tile.

Protected Attributes

- AIE_Program * program

  Keep a reference to the AIE_Program with the full tile and memory view.
- tile_infrastructure< geo > ti

  Keep a reference to the tile_infrastructure hardware features.

Private Types

- using geo = typename AIE_Program::device::geo
- using geo = typename AIE_Program::device::geo

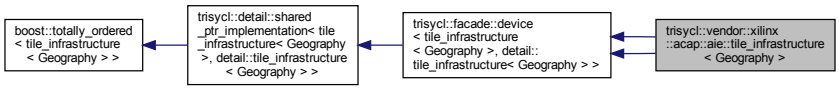
9.1.2.20 class trisycl::vendor::xilinx::acap::aie::tile_infrastructure

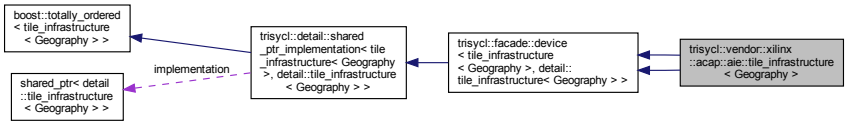
template<typename Geography>
class trisycl::vendor::xilinx::acap::aie::tile_infrastructure< Geography >

The AI Engine tile infrastructure common to all the tiles.



This allows some type erasure while accessing the common tile infrastructure.

Parameters



Geography	is the `geography` type representing the full layout of the architecture

Definition at line 42 of file tile_infrastructure.hpp.

Collaboration diagram for trisycl::vendor::xilinx::acap::aie::tile_infrastructure< Geography >:

Public Types

- using facade_t = facade::device< tile_infrastructure< Geography >, dti >

  The façade used to implement part of the user-facing type.
- using geo = Geography
- using axi_ss_geo = typename dti::axi_ss_geo
- using mpl = typename dti::mpl
- using spl = typename dti::spl
- using axi_ss_t = typename dti::axi_ss_t
- using facade_t = facade::device< tile_infrastructure< Geography >, dti >

  The façade used to implement part of the user-facing type.
- using geo = Geography
- using axi_ss_geo = typename dti::axi_ss_geo
- using mpl = typename dti::mpl
- using spl = typename dti::spl
- using axi_ss_t = typename dti::axi_ss_t

Public Member Functions

- tile_infrastructure (int x, int y, auto &dev, ::trisycl::detail::fiber_pool &fiber_executor)

  Start the tile infrastructure associated to the AIE device.
- tile_infrastructure ()=default
- int x ()

  Get the horizontal coordinate.
- int y ()

Get the vertical coordinate.

- auto & mem ()

  Access to the common infrastructure part of a tile memory.

- template<typename Invocable >
  void submit (Invocable &&f) const

  Submit a command group to the tile.

- auto & in_connection (int port)

  Get the user input connection from the AXI stream switch.

- auto & out_connection (int port)

  Get the user output connection to the AXI stream switch.

- auto & in (int port)

  Get the user input port from the AXI stream switch.

- auto & out (int port)

  Get the user output port to the AXI stream switch.

- auto & rx_dma (int id)

  Get access to a receiver DMA.

- auto & tx_dma (int id)

  Get access to a transmit DMA.

- auto & input (spl p)

  Get the input router port of the AXI stream switch.

- auto & output (mpl p)

  Get the output router port of the AXI stream switch.

- template<typename Work >
  auto & single_task (Work &&f)

  Launch a callable on this tile.

- auto & wait ()

  Wait for the execution of the callable on this tile.

- auto & connect (typename geo::core_axi_stream_switch::slave_port_layout sp, typename geo::core_axi_↩
  stream_switch::master_port_layout mp)

  Configure a connection of the core tile AXI stream switch.

- void display (latex::context &c) const

  Display the tile to a LaTeX context.

- tile_infrastructure (int x, int y, auto &dev, ::trisycl::detail::fiber_pool &fiber_executor)

  Start the tile infrastructure associated to the AIE device.

- tile_infrastructure ()=default

- int x ()

  Get the horizontal coordinate.

- int y ()

  Get the vertical coordinate.

- auto & mem ()

  Access to the common infrastructure part of a tile memory.

- template<typename Invocable >
  void submit (Invocable &&f) const

  Submit a command group to the tile.

- auto & in_connection (int port)

  Get the user input connection from the AXI stream switch.

- auto & out_connection (int port)

  Get the user output connection to the AXI stream switch.

- auto & in (int port)

  Get the user input port from the AXI stream switch.

- auto & out (int port)

Get the user output port to the AXI stream switch.

- auto & rx_dma (int id)

  Get access to a receiver DMA.
- auto & tx_dma (int id)

  Get access to a transmit DMA.
- auto & input (spl p)

  Get the input router port of the AXI stream switch.
- auto & output (mpl p)

  Get the output router port of the AXI stream switch.
- template<typename Work >
  auto & single_task (Work &&f)

  Launch a callable on this tile.
- auto & wait ()

  Wait for the execution of the callable on this tile.
- auto & connect (typename geo::core_axi_stream_switch::slave_port_layout sp, typename geo::core_axi_↩ stream_switch::master_port_layout mp)

  Configure a connection of the core tile AXI stream switch.
- void display (latex::context &c) const

  Display the tile to a LaTeX context.

Static Public Member Functions

- static constexpr int x_size ()

  Get the horizontal number of tiles.
- static constexpr int y_size ()

  Get the vertical number of tiles.
- static vec< int, 2 > display_size ()

  Compute the size of the graphics representation of the tile.
- static constexpr int x_size ()

  Get the horizontal number of tiles.
- static constexpr int y_size ()

  Get the vertical number of tiles.
- static vec< int, 2 > display_size ()

  Compute the size of the graphics representation of the tile.

Private Types

- using dti = detail::tile_infrastructure< Geography >

  The type encapsulating the implementation.
- using dti = detail::tile_infrastructure< Geography >

  The type encapsulating the implementation.

9.1.2.20.2 Constructor & Destructor Documentation

9.1.2.20.2.1 tile_infrastructure() [1/4] template<typename Geography >

```
trisycl::vendor::xilinx::acap::aie::tile_infrastructure< Geography >::tile_infrastructure (
            int x,
            int y,
            auto & dev,
            ::trisycl::detail::fiber_pool & fiber_executor )  [inline]
```

Start the tile infrastructure associated to the AIE device.

Parameters

in	*x*	is the horizontal coordinate for this tile
in	*y*	is the vertical coordinate for this tile
in	*dev*	is the aie::detail::device used to control hardware when using real hardware and provide some debug information from inside the tile_infrastructure. Use auto concept here to avoid explicit type causing circular dependency
in	*fiber_executor*	is the executor used to run infrastructure details

Definition at line 75 of file tile_infrastructure.hpp.

```
00077       :  facade_t { std::make_shared<dti>(x, y, dev, fiber_executor) } {}
```

9.1.2.20.3.8 in() [2/2] template<typename Geography >

```
auto & trisycl::vendor::xilinx::acap::aie::tile_infrastructure< Geography >::in (
            int port )  [inline]
```

Get the user input port from the AXI stream switch.

Parameters

in	*port*	is the port to use

Definition at line 135 of file tile_infrastructure.hpp.

```
00135 { return implementation->in(port); }
```

References trisycl::detail::shared_ptr_implementation< tile_infrastructure< Geography >, detail::tile_infrastructure< Geography > >

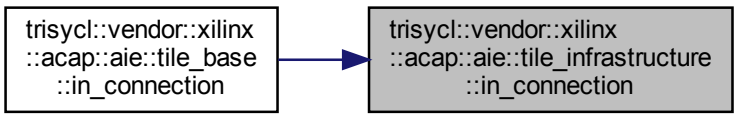
9.1.2.20.3.9 in_connection() [1/2] template<typename Geography >

```
auto & trisycl::vendor::xilinx::acap::aie::tile_infrastructure< Geography >::in_connection (
            int port )  [inline]
```

Get the user input connection from the AXI stream switch.

Parameters

in	*port*	is the port to use



Definition at line 121 of file tile_infrastructure.hpp.

```
00121 { return implementation->in_connection(port); }
```

9.1.2.20.3.10 in_connection() [2/2] template<typename Geography >

```
auto & trisycl::vendor::xilinx::acap::aie::tile_infrastructure< Geography >::in_connection (
            int port )  [inline]
```

Get the user input connection from the AXI stream switch.

Parameters

in	*port*	is the port to use

Definition at line 121 of file tile_infrastructure.hpp.

```
00121 { return implementation->in_connection(port); }
```

References trisycl::detail::shared_ptr_implementation< tile_infrastructure< Geography >, detail::tile_infrastructure< Geography > >

9.1.2.20.3.11 input() [1/2] template<typename Geography >

```
auto & trisycl::vendor::xilinx::acap::aie::tile_infrastructure< Geography >::input (
            spl p )  [inline]
```

Get the input router port of the AXI stream switch.

Parameters

p	is the slave_port_layout for the stream

Definition at line 157 of file tile_infrastructure.hpp.

```
00157 { return implementation->input(p); }
```

References trisycl::detail::shared_ptr_implementation< tile_infrastructure< Geography >, detail::tile_infrastructure< Geography > > and p.

9.1.2.20.3.12 input() [2/2] template<typename Geography >

```
auto & trisycl::vendor::xilinx::acap::aie::tile_infrastructure< Geography >::input (
            spl p )  [inline]
```

Get the input router port of the AXI stream switch.

Parameters

p	is the slave_port_layout for the stream

Definition at line 157 of file tile_infrastructure.hpp.

```
00157 { return implementation->input(p); }
```

References trisycl::detail::shared_ptr_implementation< tile_infrastructure< Geography >, detail::tile_infrastructure< Geography > > and p.

9.1.2.20.3.13 mem() [1/2] template<typename Geography >

```
auto & trisycl::vendor::xilinx::acap::aie::tile_infrastructure< Geography >::mem ( )  [inline]
```

Access to the common infrastructure part of a tile memory.

Definition at line 96 of file tile_infrastructure.hpp.

```
00096               {
00097     return implementation->mem();
00098   }
```

References trisycl::detail::shared_ptr_implementation< tile_infrastructure< Geography >, detail::tile_infrastructure< Geography > >

9.1.2.20.3.14 mem() [2/2] template<typename Geography >

```
auto & trisycl::vendor::xilinx::acap::aie::tile_infrastructure< Geography >::mem ( )  [inline]
```

Access to the common infrastructure part of a tile memory.

Definition at line 96 of file tile_infrastructure.hpp.

```
00096               {
00097     return implementation->mem();
00098   }

```

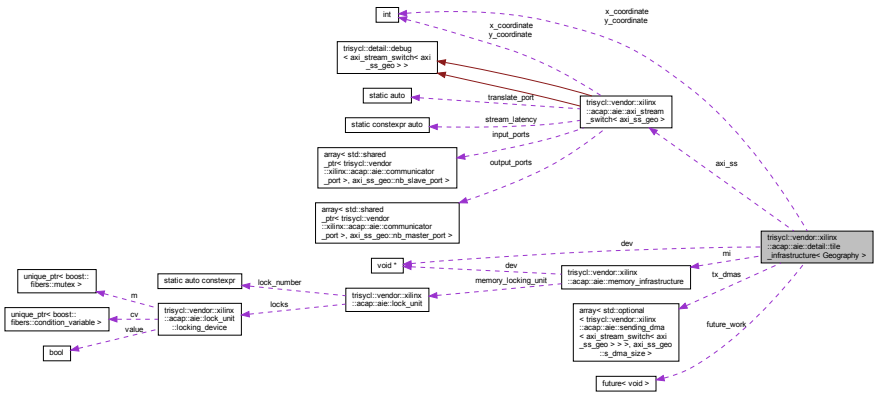
9.1.2.21 class trisycl::vendor::xilinx::acap::aie::detail::tile_infrastructure

template<typename Geography>
class trisycl::vendor::xilinx::acap::aie::detail::tile_infrastructure< Geography >

The AI Engine tile infrastructure common to all the tiles.



This allows some type erasure while accessing the common tile infrastructure.

Parameters

AIE	is the type representing the full CGRA with the programs and memory contents

Definition at line 51 of file tile_infrastructure.hpp.

Public Member Functions

- tile_infrastructure (int x, int y, auto &dev, ::trisycl::detail::fiber_pool &fiber_executor)

  Start the tile infrastructure associated to the AIE device tile.
- int x ()

  Get the horizontal coordinate.
- int y ()

  Get the vertical coordinate.
- auto & mem ()

  Access to the common infrastructure part of a tile memory.
- auto & in_connection (int port)

  Get the user input connection from the AXI stream switch.
- auto & out_connection (int port)

  Get the user output connection to the AXI stream switch.
- auto & in (int port)

  Get the user input port from the AXI stream switch.
- auto & out (int port)

  Get the user output port to the AXI stream switch.
- auto & rx_dma (int id)

  Get access to a receiver DMA.
- auto & tx_dma (int id)

  Get access to a transmit DMA.
- auto & input (spl p)

  Get the input router port of the AXI stream switch.
- auto & output (mpl p)

  Get the output router port of the AXI stream switch.
- template<typename Work >
  void single_task (Work &&f)

  Launch an invocable on this tile.
- void wait ()

  Wait for the execution of the callable on this tile.
- void connect (typename geo::core_axi_stream_switch::slave_port_layout sp, typename geo::core_axi_↩ stream_switch::master_port_layout mp)

  Configure a connection of the core tile AXI stream switch.
- void display (latex::context &c) const

  Display the tile to a LaTeX context.
- tile_infrastructure (int x, int y, auto &dev, ::trisycl::detail::fiber_pool &fiber_executor)

  Start the tile infrastructure associated to the AIE device tile.
- int x ()

  Get the horizontal coordinate.
- int y ()

  Get the vertical coordinate.
- auto & mem ()

  Access to the common infrastructure part of a tile memory.
- auto & in_connection (int port)

  Get the user input connection from the AXI stream switch.
- auto & out_connection (int port)

  Get the user output connection to the AXI stream switch.
- auto & in (int port)

  Get the user input port from the AXI stream switch.
- auto & out (int port)

Get the user output port to the AXI stream switch.

- auto & rx_dma (int id)

  Get access to a receiver DMA.
- auto & tx_dma (int id)

  Get access to a transmit DMA.
- auto & input (spl p)

  Get the input router port of the AXI stream switch.
- auto & output (mpl p)

  Get the output router port of the AXI stream switch.
- template<typename Work >
  void single_task (Work &&f)

  Launch an invocable on this tile.
- void wait ()

  Wait for the execution of the callable on this tile.
- void connect (typename geo::core_axi_stream_switch::slave_port_layout sp, typename geo::core_axi_↩ stream_switch::master_port_layout mp)

  Configure a connection of the core tile AXI stream switch.
- void display (latex::context &c) const

  Display the tile to a LaTeX context.

Static Public Member Functions

- static vec< int, 2 > display_core_size ()

  Compute the size of the graphics representation of the processor.
- static vec< int, 2 > display_size ()

  Compute the size of the graphics representation of the tile.
- static vec< int, 2 > display_core_size ()

  Compute the size of the graphics representation of the processor.
- static vec< int, 2 > display_size ()

  Compute the size of the graphics representation of the tile.

Static Private Member Functions

- static auto translate_input_port (int port)

  Map the user input port number to the AXI stream switch port.
- static auto translate_output_port (int port)

  Map the user output port number to the AXI stream switch port.
- static auto translate_input_port (int port)

  Map the user input port number to the AXI stream switch port.
- static auto translate_output_port (int port)

  Map the user output port number to the AXI stream switch port.

Private Attributes

- int x_coordinate

  Keep the horizontal coordinate.
- int y_coordinate

  Keep the vertical coordinate.
- void * dev

  Keep track of the aie::detail::device for hardware resource control in device mode or for debugging purpose for better messages.
- axi_ss_t axi_ss

  The AXI stream switch of the core tile.
- aie::memory_infrastructure mi

  Keep track of all the infrastructure tile memories of this device.
- std::array< std::optional< sending_dma< axi_ss_t > >, axi_ss_geo::s_dma_size > tx_dmas

  Sending DMAs.
- std::future< void > future_work

  Keep track of the std::thread execution in this tile.

9.1.2.21.1 Member Typedef Documentation

9.1.2.21.1.1 axi_ss_geo [1/2] template<typename Geography >

Definition at line 57 of file tile_infrastructure.hpp.

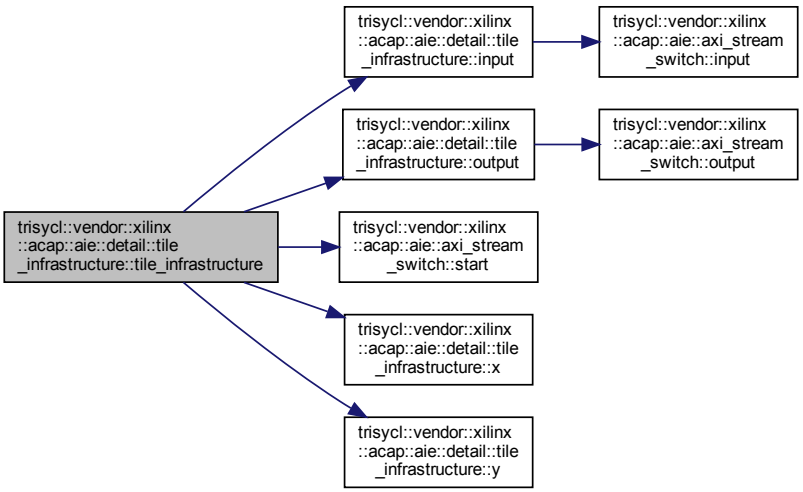
9.1.2.21.2 Constructor & Destructor Documentation

9.1.2.21.2.1 tile_infrastructure() [1/2] template<typename Geography >

```
trisycl::vendor::xilinx::acap::aie::detail::tile_infrastructure< Geography >::tile_infrastructure
(
            int x,
            int y,
            auto & dev,
            ::trisycl::detail::fiber_pool & fiber_executor )  [inline]
```

Start the tile infrastructure associated to the AIE device tile.

Parameters



in	*x*	is the horizontal coordinate for this tile
in	*y*	is the vertical coordinate for this tile
in	*dev*	is the aie::detail::device used to control hardware when using real hardware and provide some debug information from inside the tile_infrastructure. Use auto concept here to avoid explicit type causing circular dependency
in	*fiber_executor*	is the executor used to run infrastructure details

Definition at line 132 of file tile_infrastructure.hpp.

```
00134       :  x_coordinate { x }
00135       , y_coordinate { y }

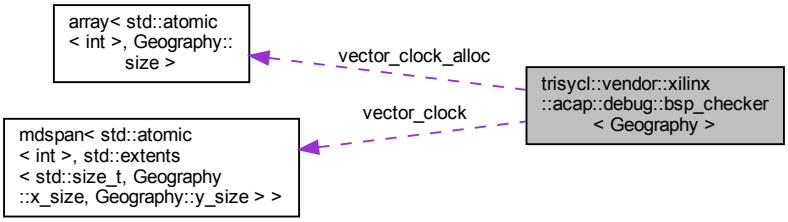
9.3.2 Class Documentation

9.3.2.1 class trisycl::vendor::xilinx::acap::debug::bsp_checker



template<typename Geography>
class trisycl::vendor::xilinx::acap::debug::bsp_checker< Geography >

Verify that an SPMD program has a bulk-synchronous behaviour across all the tiles of the CGRA.

If there are some discrepancies, display the tile id which is too late or too early.

Definition at line 41 of file debug.hpp.

Collaboration diagram for trisycl::vendor::xilinx::acap::debug::bsp_checker< Geography >:

Public Member Functions

- void check (int x, int y)

  Check that none of the tiles executing this are separated by more than one execution step each other.
- void check (int x, int y)

  Check that none of the tiles executing this are separated by more than one execution step each other.

Private Attributes

- std::array< std::atomic< int >, Geography::size > vector_clock_alloc

  A vector clock to compare differerent tiles together.
- std::mdspan< std::atomic< int >, std::extents< std::size_t, Geography::x_size, Geography::y_size > > vector_clock { &vector_clock_alloc[0] }

9.3.2.1.1 Member Function Documentation

9.3.2.1.1.1 check() [1/2] template<typename Geography >

```
void trisycl::vendor::xilinx::acap::debug::bsp_checker< Geography >::check (
              int x,
              int y )  [inline]
```

Check that none of the tiles executing this are separated by more than one execution step each other.

This functions has to be called in a BSP synchronous way by all the tiles.

Definition at line 55 of file debug.hpp.

```
00055                                {
00056     ++vector_clock[x, y];
00057     /* While the algorithm execution is not atomic, it is enough to
00058 find some asynchronous bugs */
00059     auto [min_element, max_element] = std::minmax_element(
00060         vector_clock_alloc.cbegin(), vector_clock_alloc.cend());

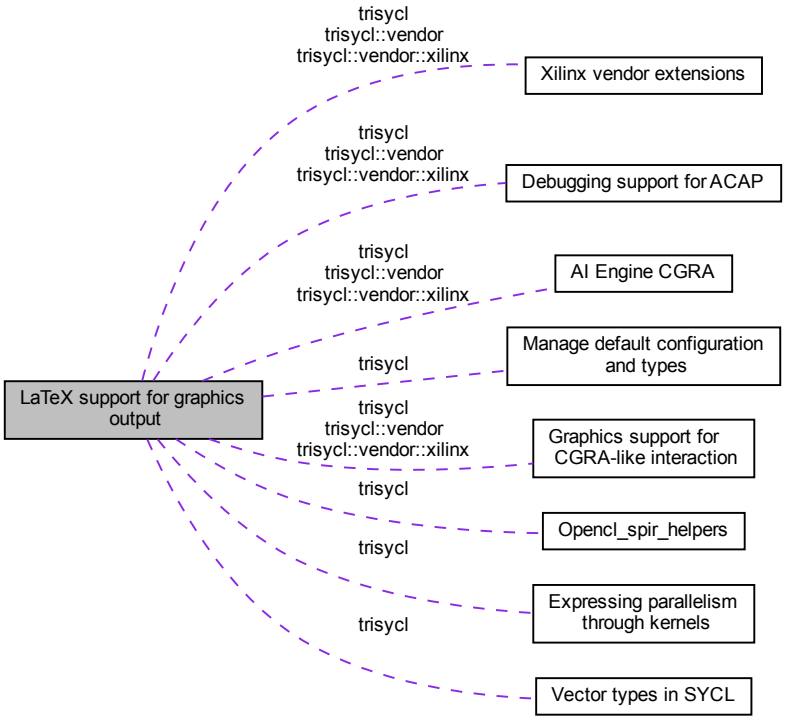
  The vector type to be used as SYCL vector.
- namespace trisycl::vendor
- namespace trisycl::vendor::xilinx
- namespace trisycl::vendor::xilinx::graphics



9.4.1 Detailed Description

This can create a graphics application and typically update some sub-images on a frame.

9.5 LaTeX support for graphics output

This can generate LaTeX output used to display internal configuration for debug or teaching purpose.

Collaboration diagram for LaTeX support for graphics output:

Namespaces

- namespace trisycl

  The vector type to be used as SYCL vector.
- namespace trisycl::vendor
- namespace trisycl::vendor::xilinx
- namespace trisycl::vendor::xilinx::latex

9.5.1 Detailed Description

This can generate LaTeX output used to display internal configuration for debug or teaching purpose.

9.6 Data access and storage in SYCL

Collaboration diagram for Data access and storage in SYCL:

Namespaces

- namespace trisycl::access

  Describe the type of access by kernels.

Classes

- class trisycl::vendor::trisycl::pipe::cout

  triSYCL extension for SYCL pipe object sending data to std::cout More...
- class trisycl::accessor< DataType, Dimensions, AccessMode, Target >

  The accessor abstracts the way buffer or pipe data are accessed inside a kernel in a multidimensional variable length array way. More...
- class trisycl::detail::accessor_base

  The buffer accessor base is here mainly to be accessed from the task without dependency on the buffer data types. More...
- class trisycl::detail::accessor< T, Dimensions, Mode, access::target::local >

  The local accessor specialization abstracts the way local memory is allocated to a kernel to be shared between work-items of the same work-group. More...
- class trisycl::buffer< T, Dimensions, Allocator >

  A SYCL buffer is a multidimensional variable length array (à la C99 VLA or even Fortran before) that is used to store data to work on. More...
- class trisycl::detail::accessor< T, Dimensions, Mode, Target >

  The buffer accessor abstracts the way buffer data are accessed inside a kernel in a multidimensional variable length array way. More...
- class trisycl::detail::buffer< T, Dimensions >

  A SYCL buffer is a multidimensional variable length array (à la C99 VLA or even Fortran before) that is used to store data to work on. More...
- struct trisycl::detail::buffer_base

  Factorize some template independent buffer aspects in a base class. More...
- class trisycl::detail::buffer_waiter< T, Dimensions, Allocator >

  A helper class to wait for the final buffer destruction if the conditions for blocking are met. More...
- struct trisycl::image< Dimensions >
- class trisycl::pipe< Name, T, MinCapacity, SizeT >

  SYCL pipe object. More...

Typedefs

- template<typename T >
  using trisycl::buffer_allocator = std::allocator< T >

  The allocator objects give the programmer some control on how the memory is allocated inside SYCL.
- template<typename T >
  using trisycl::image_allocator = std::allocator< T >

  The allocator used for the `image` inside SYCL.
- template<typename T >
  using trisycl::map_allocator = std::allocator< T >

  The allocator used to map the memory at the same place.

Functions

- template<std::forward_iterator FIB, std::forward_iterator FIE>
  trisycl::buffer (FIB begin, FIE end) -> buffer< typename std::iterator_traits< FIB >::value_type, 1 >

  A deduction guide to infer the buffer type from the read-write forward iterators into a copy-in on construction and copy-back on destruction.
- trisycl::buffer (auto &host_data) -> buffer< std::ranges::range_value_t< decltype(host_data)>, 1 >

  A deduction guide to infer the buffer type from the read-write range.
- template<typename BufferDetail >
  static std::shared_ptr< detail::task > trisycl::detail::buffer_add_to_task (BufferDetail buf, handler *command_group_handler, bool is_write_mode)

  Proxy function to avoid some circular type recursion.
- static std::shared_ptr< detail::task > trisycl::detail::add_buffer_to_task (handler *command_group_handler, std::shared_ptr< detail::buffer_base > b, bool is_write_mode)
- template<typename T , int Dimensions = 1, typename Allocator = buffer_allocator<std::remove_const_t<T>>>
  auto trisycl::detail::waiter (detail::buffer< T, Dimensions > *b)

  Helper function to create a new buffer_waiter.

9.6.1 Detailed Description

9.6.2 Class Documentation

9.6.2.1 class trisycl::vendor::trisycl::pipe::cout

triSYCL extension for SYCL pipe object sending data to std::cout

Experiment with a new pipe extension to send data to std::cout with a simplified pipe extension like with:

```
sycl::vendor::trisycl::pipe::cout::write("salut !\n");
sycl::vendor::trisycl::pipe::cout::stream() « "hello " « 42 « std::endl;
```

Definition at line 28 of file cout.hpp.

Static Public Member Functions

- static auto & stream ()

  Provide the usual stream interface to std::cout.
- template<typename T >
  static void write (const T &value)

  Send some value to std::cout.
- static auto & stream ()

  Provide the usual stream interface to std::cout.
- template<typename T >
  static void write (const T &value)

  Send some value to std::cout.

9.6.2.1.1 Member Function Documentation

9.6.2.1.1.1 stream() [1/2] static auto & trisycl::vendor::trisycl::pipe::cout::stream ( ) [inline], [static]

Provide the usual stream interface to std::cout.

Definition at line 33 of file cout.hpp.

```
00033                           {
00034     return std::cout;
00035   }
```

Referenced by write().

Here is the caller graph for this function:

9.6.2.1.1.2 stream() [2/2] static auto & trisycl::vendor::trisycl::pipe::cout::stream ( ) [inline], [static]

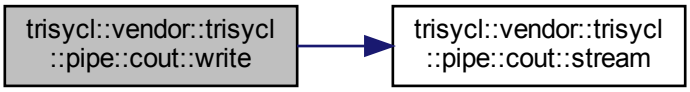
Provide the usual stream interface to std::cout.

Definition at line 33 of file cout.hpp.

```
00033                           {
00034     return std::cout;
00035   }
```

9.6.2.1.1.3 write() [1/2] template<typename T >

```
static void trisycl::vendor::trisycl::pipe::cout::write (
            const T & value ) [inline], [static]
```



Send some value to std::cout.

Definition at line 39 of file cout.hpp.

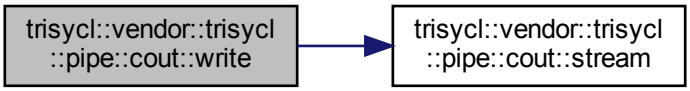
```
00039                                   {
00040     stream() « value;
00041   }
```

References stream().

Here is the call graph for this function:

9.6.2.1.1.4 write() [2/2] template<typename T >

```
static void trisycl::vendor::trisycl::pipe::cout::write (
              const T & value )  [inline], [static]
```



Send some value to std::cout.

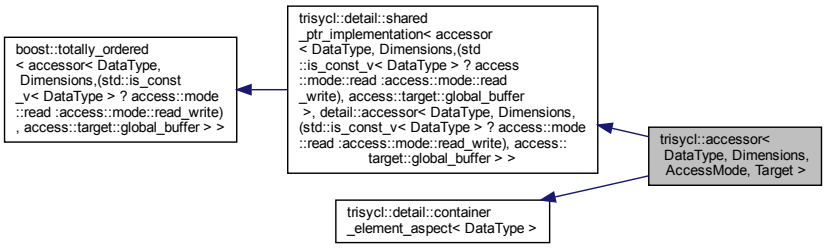
Definition at line 39 of file cout.hpp.

```
00039                                   {
00040     stream() « value;
00041   }
```

References stream().

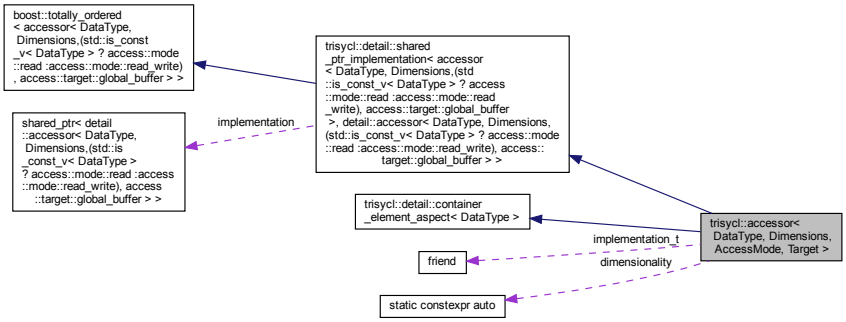
Here is the call graph for this function:

9.6.2.2 class trisycl::accessor



template<typename DataType, int Dimensions, access::mode AccessMode = (std::is_const_v<DataType> ? access::mode::read : access::mode::read_write), access::target Target = access::target::global_buffer>
class trisycl::accessor< DataType, Dimensions, AccessMode, Target >

The accessor abstracts the way buffer or pipe data are accessed inside a kernel in a multidimensional variable length array way.



Todo Implement it for images according so section 3.3.4.5

Definition at line 54 of file accessor.hpp.

Inheritance diagram for trisycl::accessor< DataType, Dimensions, AccessMode, Target >:

Collaboration diagram for trisycl::accessor< DataType, Dimensions, AccessMode, Target >:

Public Member Functions

- template<typename Allocator >
  accessor (buffer< DataType, Dimensions, Allocator > &target_buffer, handler &command_group_handler)

  Construct a buffer accessor from a buffer using a command group handler object from the command group scope.
- template<typename Allocator >
  accessor (buffer< DataType, Dimensions, Allocator > &target_buffer)

  Construct a buffer accessor from a buffer.
- template<typename Allocator >
  accessor (buffer< DataType, Dimensions, Allocator > &target_buffer, handler &command_group_handler, const range< Dimensions > &offset, const range< Dimensions > &range)

  Construct a buffer accessor from a buffer given a specific range for access permissions and an offset that provides the starting point for the access range using a command group handler object from the command group scope.
- accessor (const range< Dimensions > &allocation_size, handler &command_group_handler)

  Construct an accessor of dimension Dimensions with elements of type DataType using the passed range to specify the size in each dimension.
- auto get_range () const

  Return a range object representing the size of the buffer in terms of number of elements in each dimension as passed to the constructor.
- auto get_count () const

  Returns the total number of elements behind the accessor.

- auto get_size () const

  Returns the size of the underlying buffer storage in bytes.
- template<std::integral... T>
  decltype(auto) operator[ ] (T... indices)

  Use the accessor with integers à la [i1][i2][i3] or C++23 [i1, i2,...].
- template<std::integral... T>
  decltype(auto) operator[ ] (T... indices) const

  Use the accessor with integers à la [i1][i2][i3] or C++23 [i1, i2,...].
- auto & operator[ ] (const id< dimensionality > &index)

  To use the accessor with [id<>].
- auto & operator[ ] (const id< dimensionality > &index) const

  To use the accessor with [id<>].
- auto & operator[ ] (const item< dimensionality > &index)

  To use an accessor with [item<>].
- auto & operator[ ] (const item< dimensionality > &index) const

  To use an accessor with [item<>].
- auto & operator[ ] (const nd_item< dimensionality > &index)

  To use an accessor with an [nd_item<>].
- auto & operator[ ] (const nd_item< dimensionality > &index) const

  To use an accessor with an [nd_item<>].
- accessor_detail::reference operator* ()

  Get the first element of the accessor.
- accessor_detail::reference operator* () const

  Get the first element of the accessor.
- auto get_pointer () const

  Get the pointer to the start of the data.
- accessor_detail::iterator begin () const

  Forward all the iterator functions to the implementation.
- accessor_detail::iterator end () const
- accessor_detail::const_iterator cbegin () const
- accessor_detail::const_iterator cend () const
- accessor_detail::reverse_iterator rbegin () const
- accessor_detail::reverse_iterator rend () const
- accessor_detail::const_reverse_iterator crbegin () const
- accessor_detail::const_reverse_iterator crend () const

9.6.2.2.2.1 accessor() [1/4]

```
template<typename DataType , int Dimensions, access::mode Access↩
Mode = (std::is_const_v<DataType> ?  access::mode::read :  access::mode::read_write), access::target
Target = access::target::global_buffer>
template<typename Allocator >
trisycl::accessor< DataType, Dimensions, AccessMode, Target >::accessor (
            buffer< DataType, Dimensions, Allocator > & target_buffer,
            handler & command_group_handler )  [inline]
```

Construct a buffer accessor from a buffer using a command group handler object from the command group scope.

Constructor only available for global_buffer or constant_buffer target.

access_target defines the form of access being obtained.

Todo Add template allocator type in all the accessor constructors in the specification or just use a more opaque Buffer type?

Todo fix specification where access mode should be target instead

Definition at line 104 of file accessor.hpp.

```
00105                                         :  implementation_t {
00106     new detail::accessor<DataType, Dimensions, AccessMode, Target> {
00107       target_buffer.implementation->implementation, command_group_handler }
00108   } {
00109     static_assert(Target == access::target::global_buffer
00110                   || Target == access::target::constant_buffer,
00111                   "access target should be global_buffer or constant_buffer "
00112                   "when a handler is used");
00113     // Now the implementation is created, register it
00114     implementation->register_accessor();
00115   }
```

9.6.2.2.2 accessor() [2/4]

```
template<typename DataType , int Dimensions, access::mode AccessMode = (std::is_const_v<DataType> ? access::mode::read : access::mode::read_write), access::target Target = access::target::global_buffer>
template<typename Allocator >
trisycl::accessor< DataType, Dimensions, AccessMode, Target >::accessor (
            buffer< DataType, Dimensions, Allocator > & target_buffer )  [inline]
```

Construct a buffer accessor from a buffer.

Constructor only available for host_buffer target.

access_target defines the form of access being obtained.

Definition at line 125 of file accessor.hpp.

```
00126     :  implementation_t {
00127     new detail::accessor<DataType, Dimensions, AccessMode, Target> {
00128       target_buffer.implementation->implementation }
00129   } {
00130     static_assert(Target == access::target::host_buffer,
00131                   "without a handler, access target should be host_buffer");
00132   }
```

9.6.2.2.3 accessor() [3/4]

```
template<typename DataType , int Dimensions, access::mode AccessMode = (std::is_const_v<DataType> ? access::mode::read : access::mode::read_write), access::target Target = access::target::global_buffer>
template<typename Allocator >
trisycl::accessor< DataType, Dimensions, AccessMode, Target >::accessor (
            buffer< DataType, Dimensions, Allocator > & target_buffer,
            handler & command_group_handler,
            const range< Dimensions > & offset,
            const range< Dimensions > & range )  [inline]
```

Construct a buffer accessor from a buffer given a specific range for access permissions and an offset that provides the starting point for the access range using a command group handler object from the command group scope.

This accessor limits the processing of the buffer to the [offset, offset+range[for every dimension. Any other parts of the buffer will be unaffected.

Constructor only available for access modes global_buffer, and constant_buffer (see Table "Buffer accessor constructors"). access_target defines the form of access being obtained.

This accessor is recommended for discard-write and discard read write access modes, when the unaffected parts of the processing should be retained.

Definition at line 153 of file accessor.hpp.

```
00156                                       {
00157     TRISYCL_UNIMPL;
00158   }
```

References TRISYCL_UNIMPL.

9.6.2.2.4 accessor() [4/4]

```
template<typename DataType , int Dimensions, access::mode AccessMode = (std::is_const_v<DataType> ? access::mode::read : access::mode::read_write), access::target Target = access::target::global_buffer>
trisycl::accessor< DataType, Dimensions, AccessMode, Target >::accessor (
            const range< Dimensions > & allocation_size,
            handler & command_group_handler ) [inline]
```

Construct an accessor of dimension Dimensions with elements of type DataType using the passed range to specify the size in each dimension.

It needs as a parameter a command group handler object from the command group scope. Constructor only available if AccessMode is local, see Table 3.25.

Definition at line 169 of file accessor.hpp.

```
00171     :  implementation_t { new detail::accessor<DataType,
00172                                                Dimensions,
00173                                                AccessMode,
00174                                                access::target::local> {
00175       allocation_size, command_group_handler
00176         }
00177   }
00178   {
00179     static_assert(Target == access::target::local,
00180                   "This accessor constructor requires "
00181                   "access target be local");
00182   }
```

9.6.2.2.3 Member Function Documentation

9.6.2.2.3.1 access_mode()

```
template<typename DataType , int Dimensions, access::mode AccessMode = (std::is_const_v<DataType> ? access::mode::read : access::mode::read_write), access::target Target = access::target::global_buffer>
static auto constexpr trisycl::accessor< DataType, Dimensions, AccessMode, Target >::access_mode ( ) [inline], [static], [constexpr]
```

Introspect the `access_mode`.

Definition at line 80 of file accessor.hpp.

```
00080 { return AccessMode; }
```

9.6.2.2.3.2 begin()

```
template<typename DataType , int Dimensions, access::mode AccessMode = (std::is_const_v<DataType> ? access::mode::read : access::mode::read_write), access::target Target = access::target::global_buffer>
accessor_detail::iterator trisycl::accessor< DataType, Dimensions, AccessMode, Target >::begin ( ) const [inline]
```

Forward all the iterator functions to the implementation.

Todo Add these functions to the specification

Todo The fact that the lambda capture make a const copy of the accessor is not yet elegantly managed... The issue is that begin()/end() dispatch is made according to the accessor constness and not from the array member constness...

Todo try to solve it by using some enable_if on array constness?

Todo The issue is that the end may not be known if it is implemented by a raw OpenCL cl_mem... So only provide on the device the iterators related to the start? Actually the accessor needs to know a part of the shape to have the multidimentional addressing. So this only require a size_t more...

Todo Factor out these in a template helper

Definition at line 345 of file accessor.hpp.

`auto trisycl::accessor< DataType, Dimensions, AccessMode, Target >::get_size ( ) const [inline]`

Returns the size of the underlying buffer storage in bytes.

Todo It is incompatible with buffer get_size() in the spec

Todo Move on https://cvs.khronos.org/bugzilla/show_bug.cgi?id=15564 and https://cvs.khronos.org/bugzilla/show_bug.cgi?id=14404

Definition at line 226 of file accessor.hpp.

```
00226                           {
00227     return implementation->get_size();
00228   }
```

9.6.2.2.3.12 operator*() [1/2]

`template<typename DataType , int Dimensions, access::mode AccessMode = (std::is_const_v<DataType> ? access::mode::read : access::mode::read_write), access::target Target = access::target::global_buffer>`
`accessor_detail::reference trisycl::accessor< DataType, Dimensions, AccessMode, Target >::operator* ( ) [inline]`

Get the first element of the accessor.

Useful with an accessor on a scalar for example.

Todo Add in the specification

Definition at line 294 of file accessor.hpp.

```
00294                                   {
00295     return **implementation;
00296   }
```

9.6.2.2.3.13 operator*() [2/2]

```
template<typename DataType , int Dimensions, access::mode AccessMode = (std::is_const_v<DataType> ? access::mode::read : access::mode::read_write), access::target Target = access::target::global_buffer>
accessor_detail::reference trisycl::accessor< DataType, Dimensions, AccessMode, Target >::operator* ( ) const [inline]
```

Get the first element of the accessor.

Useful with an accessor on a scalar for example.

Todo Add in the specification?

Todo Add the concept of 0-dim buffer and accessor for scalar and use an implicit conversion to value_type reference to access the value with the accessor?

Definition at line 309 of file accessor.hpp.

```
00309                                                 {
00310     return **implementation;
00311   }
```

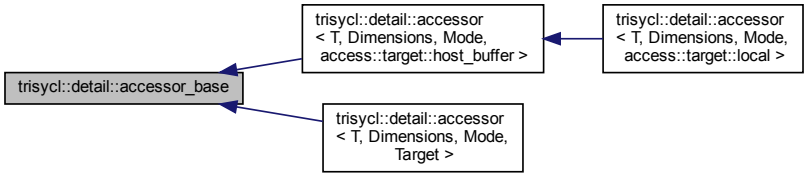
9.6.2.2.4 Member Data Documentation

9.6.2.2.4.1 dimensionality template<typename DataType , int Dimensions, access::mode AccessMode = (std::is_const_v<DataType> ? access::mode::read : access::mode::read_write), access::target Target = access::target::global_buffer> constexpr auto trisycl::accessor< DataType, Dimensions, AccessMode, Target >::dimensionality = Dimensions [static], [constexpr]

Todo in the specification: store the dimension for user request

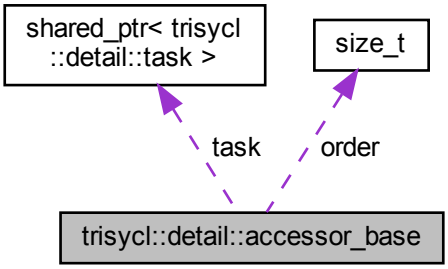
Definition at line 63 of file accessor.hpp.

9.6.2.2.4.2 implementation_t template<typename DataType , int Dimensions, access::mode AccessMode = (std::is_const_v<DataType> ? access::mode::read : access::mode::read_write), access::target Target = access::target::global_buffer> friend trisycl::accessor< DataType, Dimensions, AccessMode, Target >::implementation_t [private]



Definition at line 76 of file accessor.hpp.

9.6.2.3 class trisycl::detail::accessor_base



The buffer accessor base is here mainly to be accessed from the task without dependency on the buffer data types.

Definition at line 37 of file accessor_base.hpp.

Inheritance diagram for trisycl::detail::accessor_base:

Collaboration diagram for trisycl::detail::accessor_base:

Public Member Functions

- void set_order (std::size_t o)

  Set the order of the accessor.
- auto get_order ()

  Get the order of the accessor.
- virtual boost::compute::buffer get_cl_buffer () const =0

  Get the boost::compute::buffer or throw if unset.
- virtual ~accessor_base ()

Protected Attributes

- std::shared_ptr< detail::task > task

  The task where the accessor is used in.
- std::size_t order

  The declaration order of the accessor.

9.6.2.3.1 Constructor & Destructor Documentation

9.6.2.3.1.1 ~accessor_base() `virtual trisycl::detail::accessor_base::~accessor_base ( ) [inline], [virtual]`

Definition at line 66 of file accessor_base.hpp.

```
00066 {}
```

9.6.2.3.2 Member Function Documentation

9.6.2.3.2.1 get_cl_buffer() `virtual boost::compute::buffer trisycl::detail::accessor_base::get_↩ cl_buffer ( ) const [pure virtual]`

Get the boost::compute::buffer or throw if unset.

Implemented in trisycl::detail::accessor< T, Dimensions, Mode, Target >, and trisycl::detail::accessor< T, Dimensions, Mode, access

9.6.2.3.2.2 get_order() `auto trisycl::detail::accessor_base::get_order ( ) [inline]`

Get the order of the accessor.

Definition at line 56 of file accessor_base.hpp.

```

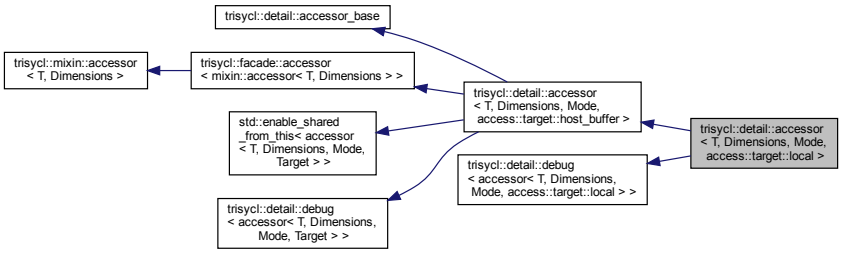
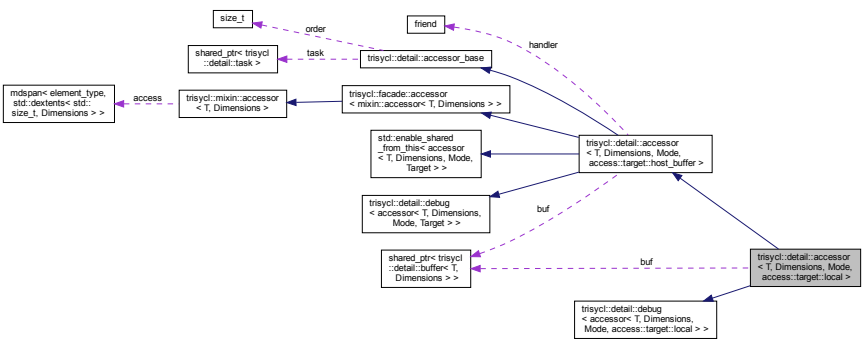
9.6.2.4 class trisycl::detail::accessor< T, Dimensions, Mode, access::target::local >

template<typename T, int Dimensions, access::mode Mode>
class trisycl::detail::accessor< T, Dimensions, Mode, access::target::local >



The local accessor specialization abstracts the way local memory is allocated to a kernel to be shared between work-items of the same work-group.

Since this a pure library implementation, implement it as a host_accessor using its own local buffer.



Todo Implement a real local accessor handling several work-group running in parallel

Definition at line 46 of file local_accessor.hpp.

9.6.2.5 class trisycl::buffer

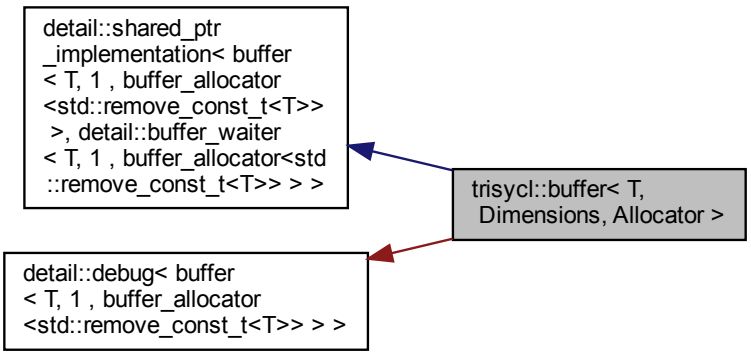
template<typename T, int Dimensions = 1, typename Allocator = buffer_allocator<std::remove_const_t<T>>> class trisycl::buffer< T, Dimensions, Allocator >

A SYCL buffer is a multidimensional variable length array (à la C99 VLA or even Fortran before) that is used to store data to work on.

Todo There is a naming inconsistency in the specification between buffer and accessor on T versus datatype

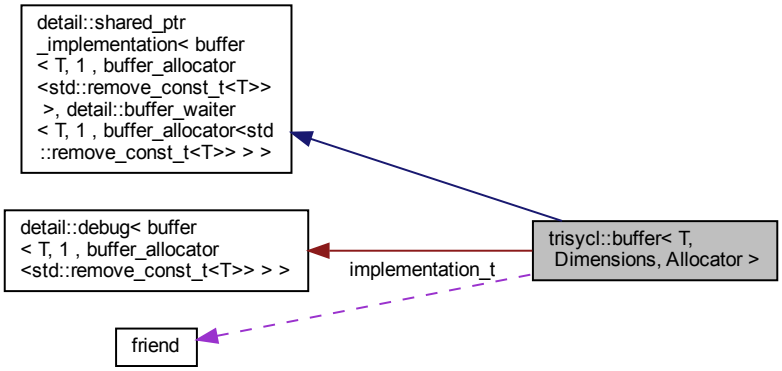
Todo Finish allocator implementation

Todo Think about the need of an allocator when constructing a buffer from other buffers



Todo Update the specification to have a non-const allocator for const buffer? Or do we rely on rebind_alloc<T>. But does this work with astate-full allocator?

Todo Add constructors from arrays so that in C++17 the range and type can be infered from the constructor



Todo Add constructors from array_ref

Definition at line 63 of file buffer.hpp.

Public Member Functions

- buffer ()=default

  Use default constructors so that we can create a new buffer copy from another one, with either a l-value or an r-value (for std::move() for example).
- buffer (const range< Dimensions > &r, Allocator allocator={})

  Create a new buffer of the given size with storage managed by the SYCL runtime.
- template<typename Dependent = T, typename = std::enable_if_t<!std::is_const<Dependent>::value>>
  buffer (const T *host_data, const range< Dimensions > &r, Allocator allocator={})

  Create a new buffer with associated host memory.
- buffer (T *host_data, const range< Dimensions > &r, Allocator allocator={})

  Create a new buffer with associated host memory.
- template<typename Range >
  requires requires { std::begin(std::declval<Range>()); std::end(std::declval<Range>()); } && (!detail::is_range_v<Range>)
  buffer (Range &host_data, Allocator allocator={})

  Create a new buffer with associated host memory from a range.
- buffer (shared_ptr_class< T > &host_data, const range< Dimensions > &buffer_range, trisycl::mutex_class &m, Allocator allocator={})

  Create a new buffer with associated memory, using the data in host_data.
- buffer (shared_ptr_class< T > host_data, const range< Dimensions > &buffer_range, Allocator allocator={})

  Create a new buffer with associated memory, using the data in host_data.
- template<typename InputIterator , typename ValueType = typename std::iterator_traits<InputIterator>::value_type>
  buffer (InputIterator start_iterator, InputIterator end_iterator, Allocator allocator={})

  Create a new allocated 1D buffer initialized from the given elements ranging from first up to one before last.

- buffer (buffer< T, Dimensions, Allocator > &b, const id< Dimensions > &base_index, const range< Dimensions > &sub_range, Allocator allocator={})

  Create a new sub-buffer without allocation to have separate accessors later.
- buffer (cl_mem mem_object, queue from_queue, event available_event={}, Allocator allocator={})

  Create a buffer from an existing OpenCL memory object associated with a context after waiting for an event signaling the availability of the OpenCL data.
- template<access::mode Mode, access::target Target = access::target::global_buffer>
  accessor< T, Dimensions, Mode, Target > get_access (handler &command_group_handler)

  Get an accessor to the buffer with the required mode.
- void mark_as_written ()

  Force the buffer to behave like if we had created an accessor in write mode.
- template<access::mode Mode>
  accessor< T, Dimensions, Mode, access::target::host_buffer > get_access ()

  Get a host accessor to the buffer with the required mode.
- auto get_range () const

  Return a range object representing the size of the buffer in terms of number of elements in each dimension as passed to the constructor.
- auto get_count () const

  Returns the total number of elements in the buffer.
- size_t get_size () const

  Returns the size of the buffer storage in bytes.
- auto use_count () const

  Returns the number of buffers that are shared/referenced.
- bool constexpr is_read_only () const

  Ask for read-only status of the buffer.
- void set_final_data (weak_ptr_class< T > finalData)

  Set destination of buffer data on destruction.
- void set_final_data (std::nullptr_t)

  Disable write-back on buffer destruction.
- bool is_cached (trisycl::context &ctx)

  Check if the buffer is already cached in a certain context.
- bool is_data_up_to_date (trisycl::context &ctx)

  Check if the data stored in the buffer is up-to-date in a certain context.
- template<typename Iterator , typename ValueType = typename std::iterator_traits< std::remove_reference_t<Iterator>>::value_type>
  void set_final_data (Iterator &&finalData)

  Set destination of buffer data on destruction.

Definition at line 73 of file buffer.hpp.

9.6.2.5.2 Constructor & Destructor Documentation

9.6.2.5.2.1 buffer() [1/10]

```
template<typename T , int Dimensions = 1, typename Allocator = buffer_allocator<std::remove_const_t<T>>>
trisycl::buffer< T, Dimensions, Allocator >::buffer ( )  [default]
```

Use default constructors so that we can create a new buffer copy from another one, with either a l-value or an r-value (for std::move() for example).

Since we just copy the shared_ptr<> from the shared_ptr_implementation above, this is where/how the sharing magic is happening with reference counting in this case.

9.6.2.5.2.2 buffer() [2/10]

```
template<typename T , int Dimensions = 1, typename Allocator = buffer↩
_allocator<std::remove_const_t<T>>>
trisycl::buffer< T, Dimensions, Allocator >::buffer (
            const range< Dimensions > & r,
            Allocator allocator = {} )  [inline]
```

Create a new buffer of the given size with storage managed by the SYCL runtime.

The default behavior is to use the default host buffer allocator, in order to allow for host accesses. If the type of the buffer, has the const qualifier, then the default allocator will remove the qualifier to allow host access to the data.

Parameters

in	*r*	defines the size
in	*allocator*	is to be used by the SYCL runtime

Definition at line 120 of file buffer.hpp.

```
00120                                                                {})
00121     :  implementation_t { detail::waiter<T, Dimensions, Allocator>(
00122                           new detail::buffer<T, Dimensions> { r }) }
00123       {}
```

9.6.2.5.2.3 buffer() [3/10]

```
template<typename T , int Dimensions = 1, typename Allocator = buffer↩
_allocator<std::remove_const_t<T>>>
template<typename Dependent = T, typename = std::enable_if_t<!std::is_const<Dependent>↩
::value>>
trisycl::buffer< T, Dimensions, Allocator >::buffer (
            const T * host_data,
            const range< Dimensions > & r,
            Allocator allocator = {} )  [inline]
```

Create a new buffer with associated host memory.

Parameters

in	*host_data*	points to the storage and values used by the buffer
in	*r*	defines the size
in	*allocator*	is to be used by the SYCL runtime, of type `trisycl::buffer_allocator<T>` by default

The host address is
`const T*`

, so the host memory is read-only.

However, the typename T is not const so the device accesses can be both read and write accesses. Since, the host_data is const, this buffer is only initialized with this memory and there is no write after its destruction, unless there is another final data address given after construction of the buffer.

Only enable this constructor if it is not the same as the one with
`const T *host_data`

, which is when `T` is already a constant type.

Todo Actually this is redundant.

Definition at line 153 of file buffer.hpp.

```
00155                                 {})
00156     :  implementation_t { detail::waiter(new detail::buffer<T, Dimensions>
00157                           { host_data, r }) }
00158   {}
```

9.6.2.5.2.4 buffer() [4/10] template<typename T , int Dimensions = 1, typename Allocator = buffer_allocator<std::remove_const_t<T>>>

```
trisycl::buffer< T, Dimensions, Allocator >::buffer (
             T * host_data,
             const range< Dimensions > & r,
             Allocator allocator = {} )  [inline]
```

Create a new buffer with associated host memory.

Parameters

in,out	*host_data*	points to the storage and values used by the buffer
in	*r*	defines the size
in	*allocator*	is to be used by the SYCL runtime, of type trisycl::buffer_allocator<T> by default

The memory is owned by the runtime during the lifetime of the object. Data is copied back to the host unless the user overrides the behavior using the set_final_data method. host_data points to the storage and values used by the buffer and range<Dimensions> defines the size.

Definition at line 177 of file buffer.hpp.

```
00179                                 {})
00180     :  implementation_t { detail::waiter(new detail::buffer<T, Dimensions>
00181                           { host_data, r }) }
00182   {}
```

9.6.2.5.2.5 buffer() [5/10] template<typename T , int Dimensions = 1, typename Allocator = buffer_allocator<std::remove_const_t<T>>>

```
template<typename Range >
requires requires { std::begin(std::declval<Range>()); std::end(std::declval<Range>()); } &&
(!detail::is_range_v<Range>)
trisycl::buffer< T, Dimensions, Allocator >::buffer (
             Range & host_data,
             Allocator allocator = {} )  [inline]
```

Create a new buffer with associated host memory from a range.

Parameters

in,out	*host_data*	points to the storage and values used by the buffer
in	*allocator*	is to be used by the SYCL runtime, of type trisycl::buffer_allocator<T> by default

The memory is owned by the runtime during the lifetime of the object. Data is copied back to the host unless the

user overrides the behavior using the set_final_data method.

Definition at line 207 of file buffer.hpp.

```
00208                                {})
00209       :  buffer { host_data.begin(),
00210                   range { std::ranges::distance(host_data) } } {}
```

9.6.2.5.2.6 buffer() [6/10]

```
template<typename T , int Dimensions = 1, typename Allocator = buffer_allocator<std::remove_const_t<T>>>
trisycl::buffer< T, Dimensions, Allocator >::buffer (
              shared_ptr_class< T > & host_data,
              const range< Dimensions > & buffer_range,
              trisycl::mutex_class & m,
              Allocator allocator = {} )  [inline]
```

Create a new buffer with associated memory, using the data in host_data.

Parameters

in,out	*host_data*	points to the storage and values used by the buffer
in	*r*	defines the size
in	*allocator*	is to be used by the SYCL runtime, of type trisycl::buffer_allocator<T> by default

The ownership of the host_data is shared between the runtime and the user. In order to enable both the user application and the SYCL runtime to use the same pointer, a trisycl::mutex_class is used. The mutex m is locked by the runtime whenever the data is in use and unlocked otherwise. Data is synchronized with host_data, when the mutex is unlocked by the runtime.

Todo update the specification to replace the pointer by a reference and provide the constructor with and without a mutex

Definition at line 233 of file buffer.hpp.

```
00236                                {}) {
00237     TRISYCL_UNIMPL;
00238   }
```

9.6.2.5.2.7 buffer() [7/10]

```
template<typename T , int Dimensions = 1, typename Allocator = buffer_allocator<std::remove_const_t<T>>>
trisycl::buffer< T, Dimensions, Allocator >::buffer (
              shared_ptr_class< T > host_data,
              const range< Dimensions > & buffer_range,
              Allocator allocator = {} )  [inline]
```

Create a new buffer with associated memory, using the data in host_data.

Parameters

in,out	*host_data*	points to the storage and values used by the buffer
in	*r*	defines the size
in	*allocator*	is to be used by the SYCL runtime, of type trisycl::buffer_allocator<T> by default

The ownership of the host_data is shared between the runtime and the user. In order to enable both the user application and the SYCL runtime to use the same pointer, a trisycl::mutex_class is used.

Todo add this mutex-less constructor to the specification

Definition at line 259 of file buffer.hpp.

```
00261                                 {})
00262     :  implementation_t { detail::waiter(new detail::buffer<T, Dimensions>
00263                          { host_data, buffer_range }) }
00264   {}
```

9.6.2.5.2.8 buffer() [8/10]

```
template<typename T , int Dimensions = 1, typename Allocator = buffer_allocator<std::remove_const_t<T>>>
template<typename InputIterator , typename ValueType = typename std::iterator_traits<InputIterator>::value_type>
trisycl::buffer< T, Dimensions, Allocator >::buffer (
            InputIterator start_iterator,
            InputIterator end_iterator,
            Allocator allocator = {} )  [inline]
```

Create a new allocated 1D buffer initialized from the given elements ranging from first up to one before last.

The data is copied to an intermediate memory position by the runtime. Data is written back to the same iterator set if the iterator is not a const iterator.

Parameters

in,out	*start_iterator*	points to the first element to copy
in	*end_iterator*	points to just after the last element to copy
in	*allocator*	is to be used by the SYCL runtime, of type trisycl::buffer_allocator<T> by default

Todo Implement the copy back at buffer destruction

Todo Generalize this for n-D and provide column-major and row-major initialization

Todo a reason to have this nD is that set_final_data(weak_ptr_class<T> & finalData) is actually doing this linearization anyway

Todo Allow read-only buffer construction too

Todo update the specification to deal with forward iterators instead and rewrite back only when it is non const and output iterator at least

Todo Allow initialization from ranges and collections à la STL

Definition at line 304 of file buffer.hpp.

```
00306                                 {}) :
00307     implementation_t { detail::waiter(new detail::buffer<T, Dimensions>
00308                        { start_iterator, end_iterator }) }
00309   {}
```

9.6.2.5.2.9 buffer() [9/10]

```
template<typename T , int Dimensions = 1, typename Allocator = buffer_allocator<std::remove_const_t<T>>>
trisycl::buffer< T, Dimensions, Allocator >::buffer (
            buffer< T, Dimensions, Allocator > & b,
            const id< Dimensions > & base_index,
            const range< Dimensions > & sub_range,
            Allocator allocator = {} )  [inline]
```

Create a new sub-buffer without allocation to have separate accessors later.

Parameters

in,out	*b*	is the buffer with the real data
in	*base_index*	specifies the origin of the sub-buffer inside the buffer b
in	*sub_range*	specifies the size of the sub-buffer

Todo To be implemented

Todo Update the specification to replace index by id

Definition at line 326 of file buffer.hpp.

```
00329                                {}) { TRISYCL_UNIMPL; }
```

9.6.2.5.2.10 buffer() [10/10]

```
template<typename T , int Dimensions = 1, typename Allocator = buffer_allocator<std::remove_const_t<T>>>
trisycl::buffer< T, Dimensions, Allocator >::buffer (
            cl_mem mem_object,
            queue from_queue,
            event available_event = {},
            Allocator allocator = {} )  [inline]
```

Create a buffer from an existing OpenCL memory object associated with a context after waiting for an event signaling the availability of the OpenCL data.

Parameters

in,out	*mem_object*	is the OpenCL memory object to use
in,out	*from_queue*	is the queue associated to the memory object
in	*available_event*	specifies the event to wait for if non null

Note that a buffer created from a cl_mem object will only have one underlying cl_mem for the lifetime of the buffer and use on an incompatible queue constitues an error.

Todo To be implemented

Todo Improve the specification to allow CLHPP objects too

Definition at line 353 of file buffer.hpp.

```
00355                                {},
00356          Allocator allocator = {}) { TRISYCL_UNIMPL;  }
```

9.6.2.5.3 Member Function Documentation

9.6.2.5.3.1 get_access() [1/2]

```
template<typename T , int Dimensions = 1, typename Allocator =
buffer_allocator<std::remove_const_t<T>>>
template<access::mode Mode>
accessor< T, Dimensions, Mode, access::target::host_buffer > trisycl::buffer< T, Dimensions,
Allocator >::get_access ( )  [inline]
```

Get a host accessor to the buffer with the required mode.

Parameters

Mode	is the requested access mode

Todo Implement the modes

Todo More elegant solution

Definition at line 408 of file buffer.hpp.

```
00408                {
00409     implementation->implementation->template track_access_mode<Mode, access::target::host_buffer>();
00410     return { *this };
00411   }
```

9.6.2.5.3.2 get_access() [2/2]

```
template<typename T , int Dimensions = 1, typename Allocator =
buffer_allocator<std::remove_const_t<T>>>
template<access::mode Mode, access::target Target = access::target::global_buffer>
accessor< T, Dimensions, Mode, Target > trisycl::buffer< T, Dimensions, Allocator >::get_↩
access (
             handler & command_group_handler )  [inline]
```

Get an accessor to the buffer with the required mode.

Parameters

	Mode	is the requested access mode
	Target	is the type of object to be accessed
in	*command_group_handler*	is the command group handler in which the kernel is to be executed

Todo Do we need for an accessor to increase the reference count of a buffer object? It does make more sense for a host-side accessor.

Todo Implement the modes and targets

Definition at line 379 of file buffer.hpp.

```
00379                                          {
00380     static_assert(Target == access::target::global_buffer
00381                   || Target == access::target::constant_buffer,
```

```
00382                   "get_access(handler) can only deal with access::global_buffer"
00383                   " or access::constant_buffer (for host_buffer accessor"
00384                   " do not use a command group handler");
00385     implementation->implementation->template track_access_mode<Mode, Target>();
00386     return { *this, command_group_handler };
00387   }
```

References trisycl::access::constant_buffer, and trisycl::access::global_buffer.

9.6.2.5.3.3 get_count() template<typename T , int Dimensions = 1, typename Allocator = buffer_allocator<std::remove_const_t<T>>>

auto trisycl::buffer< T, Dimensions, Allocator >::get_count ( ) const [inline]

Returns the total number of elements in the buffer.

Equal to get_range()[0] ∗ ... ∗ get_range()[Dimensions-1].

Definition at line 435 of file buffer.hpp.

```
00435                           {
00436     return implementation->implementation->get_count();
00437   }
```

9.6.2.5.3.4 get_range() template<typename T , int Dimensions = 1, typename Allocator = buffer_allocator<std::remove_const_t<T>>>

auto trisycl::buffer< T, Dimensions, Allocator >::get_range ( ) const [inline]

Return a range object representing the size of the buffer in terms of number of elements in each dimension as passed to the constructor.

Todo rename to the equivalent from array_ref proposals? Such as size() in http://www.open-std.org/jtc1/sc22/wg21/docs/papers/2016/p0009r2.html

Definition at line 422 of file buffer.hpp.

```
00422                           {
00423     /* Interpret the shape which is a pointer to the first element as an
00424 array of Dimensions elements so that the range<Dimensions>
00425 constructor is happy with this collection
00426 */
00427     return implementation->implementation->get_range();
00428   }
```

9.6.2.5.3.5 get_size() template<typename T , int Dimensions = 1, typename Allocator = buffer_allocator<std::remove_const_t<T>>>

size_t trisycl::buffer< T, Dimensions, Allocator >::get_size ( ) const [inline]

Returns the size of the buffer storage in bytes.

Equal to get_count()∗sizeof(T).

Todo rename to something else. In http://www.open-std.org/jtc1/sc22/wg21/docs/papers/2015/p0122r0.pdf it is named bytes() for example

Definition at line 448 of file buffer.hpp.

```
00448                           {
00449     return implementation->implementation->get_size();
00450   }
```

9.6.2.5.3.6 is_cached()

```
template<typename T , int Dimensions = 1, typename Allocator = buffer_allocator<std::remove_const_t<T>>>
bool trisycl::buffer< T, Dimensions, Allocator >::is_cached (
            trisycl::context & ctx )  [inline]
```

Check if the buffer is already cached in a certain context.

Definition at line 513 of file buffer.hpp.

```
00513                                    {
00514     return implementation->implementation->is_cached(ctx);
00515   }
```

9.6.2.5.3.7 is_data_up_to_date()

```
template<typename T , int Dimensions = 1, typename Allocator = buffer_allocator<std::remove_const_t<T>>>
bool trisycl::buffer< T, Dimensions, Allocator >::is_data_up_to_date (
            trisycl::context & ctx )  [inline]
```

Check if the data stored in the buffer is up-to-date in a certain context.

Definition at line 520 of file buffer.hpp.

```
00520                                              {
00521     return implementation->implementation->is_data_up_to_date(ctx);
00522   }
```

9.6.2.5.3.8 is_read_only()

```
template<typename T , int Dimensions = 1, typename Allocator = buffer_allocator<std::remove_const_t<T>>>
bool constexpr trisycl::buffer< T, Dimensions, Allocator >::is_read_only ( ) const  [inline], [constexpr]
```

Ask for read-only status of the buffer.

Todo Add to specification

Definition at line 475 of file buffer.hpp.

```
00475                                    {
00476     return std::is_const<T>::value;
00477   }
```

9.6.2.5.3.9 mark_as_written()

```
template<typename T , int Dimensions = 1, typename Allocator = buffer_allocator<std::remove_const_t<T>>>
void trisycl::buffer< T, Dimensions, Allocator >::mark_as_written ( )  [inline]
```

Force the buffer to behave like if we had created an accessor in write mode.

Definition at line 393 of file buffer.hpp.

```
00393                              {
00394     return implementation->implementation->mark_as_written();
00395   }
```

9.6.2.5.3.10 rank() `template<typename T , int Dimensions = 1, typename Allocator = buffer_allocator<std::remove_const_t<T>>>`

`static auto constexpr trisycl::buffer< T, Dimensions, Allocator >::rank ( ) [inline], [static], [constexpr]`

Get the number of dimensions of the buffer.

Name inspired from ISO C++ P0009 mdspan papers

Definition at line 82 of file buffer.hpp.

```
00082 { return Dimensions; }
```

9.6.2.5.3.11 set_final_data() [1/3] `template<typename T , int Dimensions = 1, typename Allocator = buffer_allocator<std::remove_const_t<T>>>`

`template<typename Iterator , typename ValueType = typename std::iterator_traits< std::remove_reference_t<Iterator>>::value_type>`

`void trisycl::buffer< T, Dimensions, Allocator >::set_final_data ( Iterator && finalData ) [inline]`

Set destination of buffer data on destruction.

WARNING: the user has to ensure that the object referred to by the iterator will be alive after buffer destruction, otherwise the behavior is undefined.

Definition at line 535 of file buffer.hpp.

```
00535                                                {
00536     implementation->implementation->set_final_data(
00537       std::forward<Iterator>(finalData));
00538   }
```

9.6.2.5.3.12 set_final_data() [2/3] `template<typename T , int Dimensions = 1, typename Allocator = buffer_allocator<std::remove_const_t<T>>>`

`void trisycl::buffer< T, Dimensions, Allocator >::set_final_data ( std::nullptr_t ) [inline]`

Disable write-back on buffer destruction.

Definition at line 505 of file buffer.hpp.

```
00505                                      {
00506     implementation->implementation->set_final_data(nullptr);
00507   }
```

9.6.2.5.3.13 set_final_data() [3/3]

```
template<typename T , int Dimensions = 1, typename Allocator
= buffer_allocator<std::remove_const_t<T>>>
void trisycl::buffer< T, Dimensions, Allocator >::set_final_data (
            weak_ptr_class< T > finalData )  [inline]
```

Set destination of buffer data on destruction.

The finalData points to the host memory to which, the outcome of all the buffer processing is going to be copied to.

This is the final pointer, which is going to be accessible after the destruction of the buffer and in the case where this is a valid pointer, the data are going to be copied to this host address.

finalData is different from the original host address, if the buffer was created associated with one. This is mainly to be used when a shared_ptr is given in the constructor and the output data will reside in a different location from the initialization data.

It is defined as a weak_ptr referring to a shared_ptr that is not associated with the trisycl::buffer, and so the trisycl::buffer will have no ownership of finalData.

Definition at line 498 of file buffer.hpp.

```
00498                                                {
00499     implementation->implementation->set_final_data(std::move(finalData));
00500   }
```

9.6.2.5.3.14 use_count()

```
template<typename T , int Dimensions = 1, typename Allocator = buffer↩
_allocator<std::remove_const_t<T>>>
auto trisycl::buffer< T, Dimensions, Allocator >::use_count ( ) const  [inline]
```

Returns the number of buffers that are shared/referenced.

For example

```
trisycl::buffer<int> b { 1000 };
// Here b.use_count() should return 1
trisycl::buffer<int> c { b };
// Here b.use_count() and b.use_count() should return 2
```

Todo Add to the specification, useful for validation

Definition at line 465 of file buffer.hpp.

```
00465                                {
00466     // Rely on the shared_ptr<> use_count()
00467     return implementation.use_count();
00468   }
```

9.6.2.5.4 Member Data Documentation

9.6.2.5.4.1 implementation_t

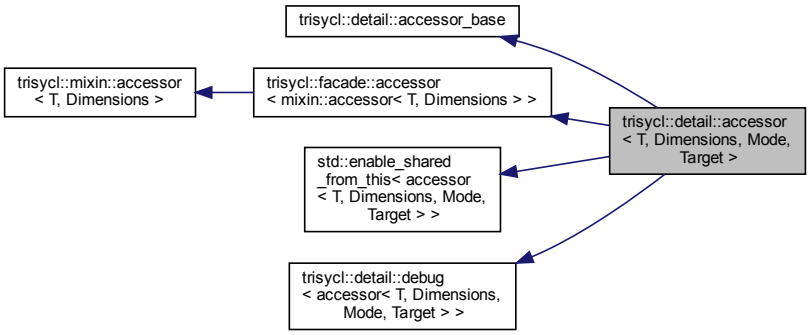
```
template<typename T , int Dimensions = 1, typename Allocator =
buffer_allocator<std::remove_const_t<T>>>
friend trisycl::buffer< T, Dimensions, Allocator >::implementation_t  [private]
```

Definition at line 90 of file buffer.hpp.

9.6.2.6 class trisycl::detail::accessor

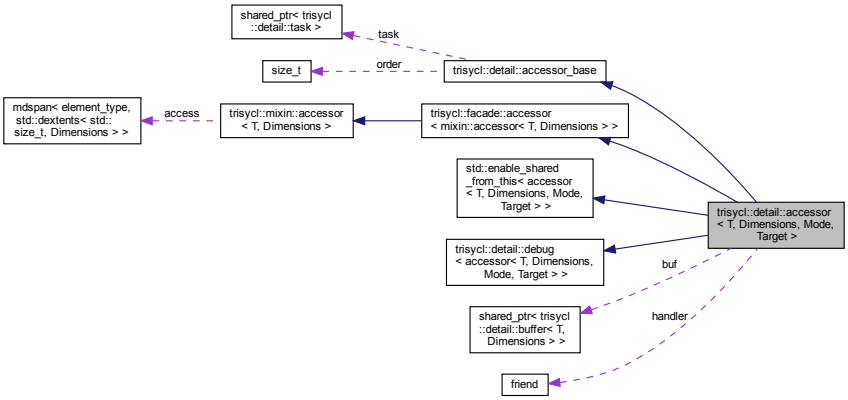
template<typename T, int Dimensions, access::mode Mode, access::target Target>
class trisycl::detail::accessor< T, Dimensions, Mode, Target >

The buffer accessor abstracts the way buffer data are accessed inside a kernel in a multidimensional variable length array way.



This implementation relies on std::mdspan to provide this nice syntax and behavior.

Right now the aim of this class is just to access to the buffer in a read-write mode, even if capturing the accessor from a lambda make it const (since in examples we have lambda with [=] without mutable lambda).



Todo Use the access::mode

Definition at line 55 of file accessor.hpp.

Inheritance diagram for trisycl::detail::accessor< T, Dimensions, Mode, Target >:

Collaboration diagram for trisycl::detail::accessor< T, Dimensions, Mode, Target >:

Public Member Functions

- accessor ()=default

  Used by the local accessor hack on top of host accessor.
- accessor (std::shared_ptr< detail::buffer< T, Dimensions > > target_buffer)

  Construct a host accessor from an existing buffer.
- accessor (std::shared_ptr< detail::buffer< T, Dimensions > > target_buffer, handler &command_group_↩ handler)

  Construct a device accessor from an existing buffer.
- void register_accessor ()

  Register the accessor once a `std::shared_ptr` is created on it.
- detail::buffer< T, Dimensions > & get_buffer ()

  Get the buffer used to create the accessor.
- constexpr bool is_read_access () const

  Test if the accessor has a read access right.
- constexpr bool is_write_access () const

  Test if the accessor has a write access right.

Protected Member Functions

- void set_buffer (std::shared_ptr< detail::buffer< T, Dimensions > > b)

  Set later the current buffer associated to this accessor.

Private Types

- using facade = facade::accessor< mixin::accessor< T, Dimensions > >

  Where most of the user-facing interface dwells.

Private Member Functions

- boost::compute::buffer get_cl_buffer () const override

  Get the boost::compute::buffer or throw if unset.
- void copy_in_cl_buffer ()

  Lazily associate a CL buffer to the SYCL buffer and copy data in it if required, updates the state of the data in the buffer across contexts.
- void copy_back_cl_buffer ()

  Does nothing.

Private Attributes

- std::shared_ptr< detail::buffer< T, Dimensions > > buf

  Keep a reference to the accessed buffer.
- friend handler

`template<typename T , int Dimensions, access::mode Mode, access::target Target>`
`constexpr bool trisycl::detail::accessor< T, Dimensions, Mode, Target >::is_read_access ( ) const [inline], [constexpr]`

Test if the accessor has a read access right.

Todo Strangely, it is not really constexpr because it is not a static method...

Todo to move in the access::mode enum class and add to the specification ?

Definition at line 174 of file accessor.hpp.

```
00174                                        {
00175     return Mode == access::mode::read || Mode == access::mode::read_write ||
00176            Mode == access::mode::discard_read_write;
00177   }
```

References trisycl::access::discard_read_write, trisycl::access::read, and trisycl::access::read_write.

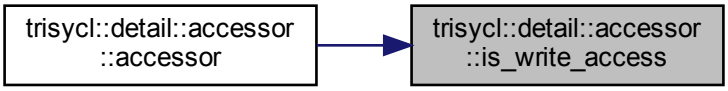
9.6.2.6.3.6 is_write_access() template<typename T , int Dimensions, access::mode Mode, access::target Target>

constexpr bool trisycl::detail::accessor< T, Dimensions, Mode, Target >::is_write_access ( ) const [inline], [constexpr]

Test if the accessor has a write access right.

Todo Strangely, it is not really constexpr because it is not a static method...

Todo to move in the access::mode enum class and add to the specification ?



Definition at line 187 of file accessor.hpp.

```
00187                                       {
00188     return Mode == access::mode::write || Mode == access::mode::read_write ||
00189            Mode == access::mode::discard_write ||
00190            Mode == access::mode::discard_read_write;
00191   }
```

References trisycl::access::discard_read_write, trisycl::access::discard_write, trisycl::access::read_write, and trisycl::access::write.

Referenced by trisycl::detail::accessor< T, Dimensions, Mode, Target >::accessor().

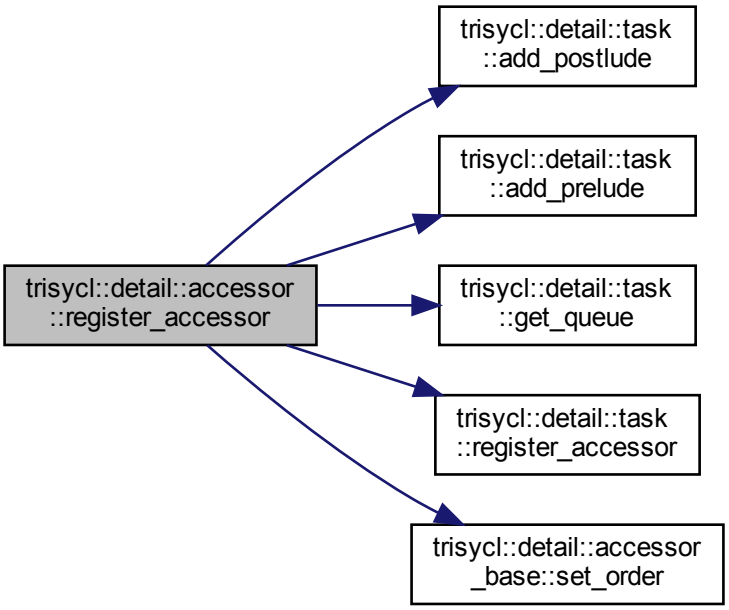
Here is the caller graph for this function:

9.6.2.6.3.7 register_accessor() template<typename T , int Dimensions, access::mode Mode, access::target Target>

void trisycl::detail::accessor< T, Dimensions, Mode, Target >::register_accessor ( ) [inline]

Register the accessor once a `std::shared_ptr` is created on it.

This is to be called from outside once the object is created. It has been tried directly inside the contructor, but calling `shared_from_this()` from the constructor dead-lock with libstdc++6



Todo Double-check with the C++ committee on this issue.

Definition at line 141 of file accessor.hpp.

```
00141                           {
00142     if (!task->get_queue()->is_host()) {
00143       // To keep alive this accessor in the following lambdas
00144       auto acc = this->shared_from_this();
00145       // Attach the accessor to the task and get its order
00146       set_order(task->register_accessor(acc));
00147 #ifdef TRISYCL_OPENCL
00148       /* Before running the kernel, make sure the cl_mem behind this
00149 accessor is up-to-date on the device if needed and pass it to
00150 the kernel */
00151       task->add_prelude([=] { acc->copy_in_cl_buffer(); });
00152       // After running the kernel, deal with some copy-back if needed
00153       task->add_postlude([=] {
00154         /* Even if this function does nothing, it is required to
00155 have the capture of acc to keep the accessor alive across
00156 the kernel execution up to the execution postlude */
00157         acc->copy_back_cl_buffer();
00158       });
00159 #endif
00160     }
00161   }
```

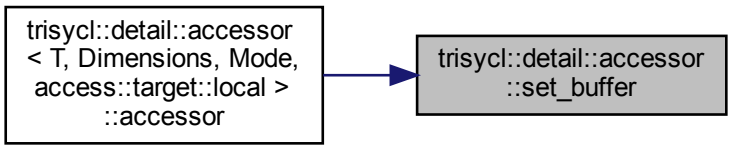
References trisycl::detail::task::add_postlude(), trisycl::detail::task::add_prelude(), trisycl::detail::task::get_queue(), trisycl::detail::task::register_accessor(), and trisycl::detail::accessor_base::set_order().

Here is the call graph for this function:

9.6.2.6.3.8 set_buffer()

```
template<typename T , int Dimensions, access::mode Mode, access::target
Target>
void trisycl::detail::accessor< T, Dimensions, Mode, Target >::set_buffer (
            std::shared_ptr< detail::buffer< T, Dimensions > > b )  [inline], [protected]
```

Set later the current buffer associated to this accessor.



Definition at line 229 of file accessor.hpp.

```
00229                                                                {

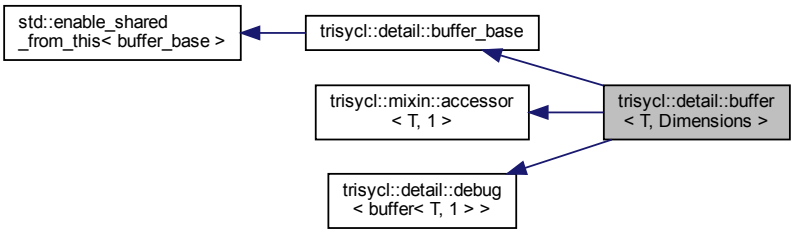
trisycl::detail::accessor< T, Dimensions, Mode, Target >::get_buffer(), trisycl::detail::accessor< T, Dimensions, Mode, Target >::get_
and trisycl::detail::accessor< T, Dimensions, Mode, Target >::set_buffer().

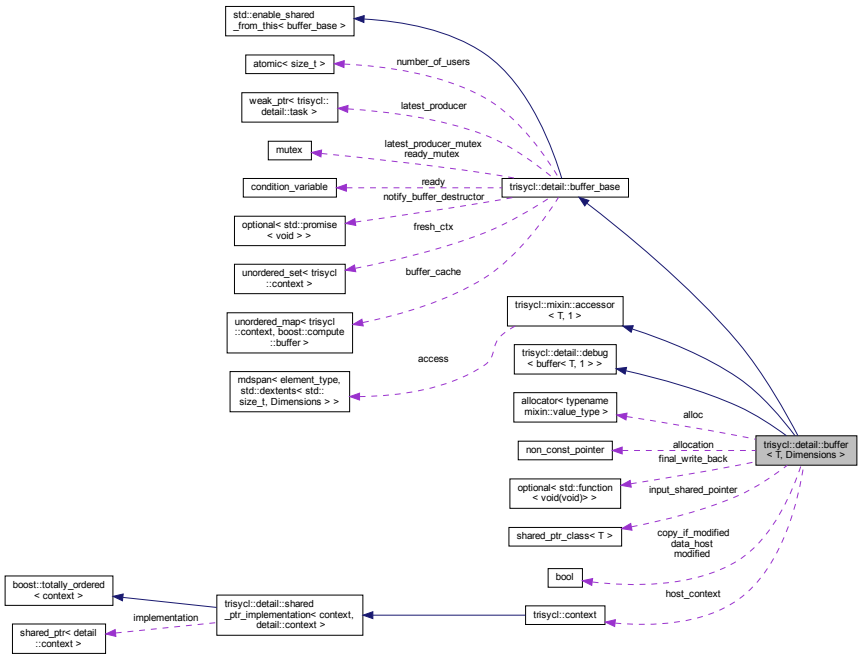
9.6.2.6.4.2 handler `template<typename T , int Dimensions, access::mode Mode, access::target Target> friend trisycl::detail::accessor< T, Dimensions, Mode, Target >::handler [private]`

Definition at line 196 of file accessor.hpp.



9.6.2.7 class trisycl::detail::buffer

template<typename T, int Dimensions = 1>
class trisycl::detail::buffer< T, Dimensions >



A SYCL buffer is a multidimensional variable length array (à la C99 VLA or even Fortran before) that is used to store data to work on.

Definition at line 37 of file buffer.hpp.

Inheritance diagram for trisycl::detail::buffer< T, Dimensions >:

Collaboration diagram for trisycl::detail::buffer< T, Dimensions >:

Public Member Functions

- buffer (const range< Dimensions > &r)

  Create a new read-write buffer of size.
- buffer (T *host_data, const range< Dimensions > &r)

  Create a new read-write buffer from.
- template<typename Dependent = T, typename = std::enable_if_t<!std::is_const<Dependent>::value>>
  buffer (const T *host_data, const range< Dimensions > &r)

  Create a new read-only buffer from.
- buffer (shared_ptr_class< T > &host_data, const range< Dimensions > &r)

  Create a new buffer with associated memory, using the data in host_data.
- template<typename Iterator >
  buffer (Iterator start_iterator, Iterator end_iterator)

  Create a new allocated 1D buffer from the given elements.
- ~buffer ()

  Create a new sub-buffer without allocation to have separate accessors later.
- void mark_as_written ()

  Enforce the buffer to be considered as being modified.
- template<access::mode Mode, access::target Target = access::target::host_buffer>
  void track_access_mode ()

  This method is to be called whenever an accessor is created.
- void set_final_data (std::weak_ptr< T > final_data)

  Set the weak pointer as destination for write-back on buffer destruction.
- void set_final_data (std::nullptr_t)

  Disable write-back on buffer destruction as an iterator.
- template<typename Iterator , typename ValueType = typename std::iterator_traits<Iterator>::value_type>
  void set_final_data (Iterator final_data)

  Provide destination for write-back on buffer destruction as an iterator.
- boost::optional< std::future< void > > get_destructor_future ()

  Get a `future` to wait from inside the `trisycl::buffer` in case there is something to copy back to the host.

Private Types

- using mixin = mixin::accessor< T, Dimensions >

Private Member Functions

- auto allocate_buffer (const range< Dimensions > &r)

  Allocate uninitialized buffer memory.
- void deallocate_buffer ()

  Deallocate buffer memory if required.
- template<typename StartIter , typename EndIter >
  void assign (StartIter start_iterator, EndIter end_iterator)

  Assign the 1-D storage behind the accessor.
- template<typename BaseType = T, typename DataType >
  void call_update_buffer_state (trisycl::context ctx, access::mode mode, size_t size, DataType *data, std::enable_if_t<!std::is_const< BaseType >::value > *=0)

  Function pair to work around the fact that T might be a `const` type.
- template<typename BaseType = T, typename DataType >
  void call_update_buffer_state (trisycl::context ctx, access::mode mode, size_t size, DataType *data, std::enable_if_t< std::is_const< BaseType >::value > *=0)

  Version of `call_update_buffer_state` that does nothing.

Private Attributes

- std::allocator< typename mixin::value_type > alloc

  The allocator to be used when some memory is needed.
- mixin::non_const_pointer allocation = nullptr

  If some allocation is requested on the host for the buffer memory, this is where the memory is attached to.
- boost::optional< std::function< void(void)> > final_write_back

  How to copy back data on buffer destruction, can be modified with set_final_data(...)
- shared_ptr_class< T > input_shared_pointer

  Keep the shared pointer used to create the buffer.
- bool data_host = false

  Track if the buffer memory is backed by user-provided host memory.
- bool copy_if_modified = false

  Track if data should be copied into buffer-owned memory if a modification occurs.
- bool modified = false
- trisycl::context host_context { trisycl::device {} }

  Track the host context.

Friends

- template<typename U , int D, access::mode Mode, access::target Target>

9.6.2.7.1 Member Typedef Documentation

9.6.2.7.1.1 mixin `template<typename T , int Dimensions = 1>`

```
using trisycl::detail::buffer< T, Dimensions >::mixin = mixin::accessor<T, Dimensions>  [private]
```

Definition at line 43 of file buffer.hpp.

9.6.2.7.2 Constructor & Destructor Documentation

9.6.2.7.2.1 buffer() `[1/5]` `template<typename T , int Dimensions = 1>`

```
trisycl::detail::buffer< T, Dimensions >::buffer (
            const range< Dimensions > & r )  [inline]
```

Create a new read-write buffer of size.

Parameters

r	

Todo Lazily allocate memory since it might not be used on host

Definition at line 88 of file buffer.hpp.

```
00090       :  mixin { allocate_buffer(r), r } {}
```

9.6.2.7.2.2 buffer() [2/5] template<typename T , int Dimensions = 1>

```
trisycl::detail::buffer< T, Dimensions >::buffer (
              T * host_data,
              const range< Dimensions > & r )  [inline]
```

Create a new read-write buffer from.

Parameters

host_data	of size
r	without further allocation

Definition at line 94 of file buffer.hpp.

```
00095       :  mixin { host_data, r }
00096       , data_host { true } {}
```

9.6.2.7.2.3 buffer() [3/5] template<typename T , int Dimensions = 1>

```
template<typename Dependent = T, typename = std::enable_if_t<!std::is_const<Dependent>↩
::value>>
trisycl::detail::buffer< T, Dimensions >::buffer (
              const T * host_data,
              const range< Dimensions > & r )  [inline]
```

Create a new read-only buffer from.

Parameters

host_data	of size
r	without further allocation

If the buffer is non const, use a copy-on-write mechanism with internal writable memory.

Todo Clarify the semantics in the spec. What happens if the host change the host_data after buffer creation?

Only enable this constructor if the value type is not constant, because if it is constant, the buffer is constant too.

Definition at line 112 of file buffer.hpp.

```
00113       :  /* The buffer is read-only, even if the internal multidimensional
00114 wrapper is not.  If a write accessor is requested, there should
00115 be a copy on write.  So this pointer should not be written and
00116 this const_cast should be acceptable.  */
00117       mixin { const_cast<T*>(host_data), r }
00118       , data_host { true }
00119       ,
00120       /* Set copy_if_modified to true, so that if an accessor with write
00121 access is created, data are copied before to be modified.  */
00122       copy_if_modified { true } {}
```

9.6.2.7.2.4 buffer() [4/5] template<typename T , int Dimensions = 1>

```
trisycl::detail::buffer< T, Dimensions >::buffer (
            shared_ptr_class< T > & host_data,
            const range< Dimensions > & r )  [inline]
```

Create a new buffer with associated memory, using the data in host_data.

The ownership of the host_data is shared between the runtime and the user. In order to enable both the user application and the SYCL runtime to use the same pointer, a trisycl::mutex_class is used.

Definition at line 132 of file buffer.hpp.

```
00133       :  mixin { host_data.get(), r }
00134       , input_shared_pointer { host_data }
00135       , data_host { true } {}
```

9.6.2.7.2.5 buffer() [5/5] template<typename T , int Dimensions = 1>

```
template<typename Iterator >
trisycl::detail::buffer< T, Dimensions >::buffer (
            Iterator start_iterator,
            Iterator end_iterator )  [inline]
```

Create a new allocated 1D buffer from the given elements.

Definition at line 139 of file buffer.hpp.

```
00140       :  mixin { allocate_buffer(std::distance(start_iterator, end_iterator)),
00141                  range<1> { static_cast<std::size_t>(
00142                      std::distance(start_iterator, end_iterator)) } } {
00143     assign(start_iterator, end_iterator);
00144   }
```

9.6.2.7.2.6 ~buffer() template<typename T , int Dimensions = 1>

```
trisycl::detail::buffer< T, Dimensions >::~buffer ( )  [inline]
```

Create a new sub-buffer without allocation to have separate accessors later.

Todo To implement and deal with reference counting buffer(buffer<T, Dimensions> b, index<Dimensions> base↩ _index, range<Dimensions> sub_range)

Todo Allow CLHPP objects too?

The buffer content may be copied back on destruction to some final location

Definition at line 165 of file buffer.hpp.

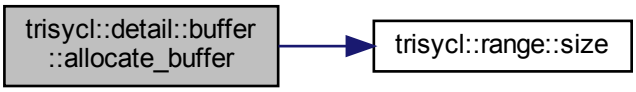
```
00165             {
00166 #ifdef TRISYCL_OPENCL
00167     /* We ensure that the host has the most up-to-date version of the data
00168 before the buffer is destroyed.  This is necessary because we do not
00169 systematically transfer the data back from a device with
00170 \c copy_back_cl_buffer any more.
00171 \todo Optimize for the case the buffer is not based on host memory
00172 */
00173     call_update_buffer_state(host_context, access::mode::read,
00174                              mixin::get_size(), mixin::data());
00175
00176 #endif
00177     if (modified && final_write_back)
00178       (*final_write_back)();
00179     // Allocate explicitly allocated memory if required
00180     deallocate_buffer();
00181   }
```

References trisycl::access::read.

9.6.2.7.3 Member Function Documentation

9.6.2.7.3.1 allocate_buffer() template<typename T , int Dimensions = 1>

```
auto trisycl::detail::buffer< T, Dimensions >::allocate_buffer (
            const range< Dimensions > & r )  [inline], [private]
```



Allocate uninitialized buffer memory.

Definition at line 259 of file buffer.hpp.

```
00259                                                {
00260     auto count = r.size();
00261     // Allocate uninitialized memory
00262     allocation = alloc.allocate(count);
00263     return allocation;
00264   }
```

References trisycl::range< Dimensions >::size().

Here is the call graph for this function:

9.6.2.7.3.2 assign() template<typename T , int Dimensions = 1>

```
template<typename StartIter , typename EndIter >
void trisycl::detail::buffer< T, Dimensions >::assign (
            StartIter start_iterator,
            EndIter end_iterator )  [inline], [private]
```

Assign the 1-D storage behind the accessor.

Use 2 different iterator types since in C++20 ranges it is now the case.

Definition at line 278 of file buffer.hpp.

```
00278                                                    {
00279     std::copy(start_iterator, end_iterator, mixin::data());
00280   }
```

9.6.2.7.3.3 call_update_buffer_state() [1/2] template<typename T , int Dimensions = 1>

```
template<typename BaseType = T, typename DataType >
void trisycl::detail::buffer< T, Dimensions >::call_update_buffer_state (
            trisycl::context ctx,
            access::mode mode,
            size_t size,
            DataType * data,
            std::enable_if_t< std::is_const< BaseType >::value > *  = 0 )  [inline], [private]
```

Version of `call_update_buffer_state` that does nothing.

It is called if the type of the data in the buffer is `const`

Definition at line 300 of file buffer.hpp.

```
00302                                                {}
```

9.6.2.7.3.4 call_update_buffer_state() [2/2] template<typename T , int Dimensions = 1>

```
template<typename BaseType = T, typename DataType >
void trisycl::detail::buffer< T, Dimensions >::call_update_buffer_state (
            trisycl::context ctx,
            access::mode mode,
            size_t size,
            DataType * data,
            std::enable_if_t<!std::is_const< BaseType >::value > *  = 0 )  [inline], [private]
```

Function pair to work around the fact that T might be a `const` type.

We call update_buffer_state only if T is not `const`, we have to use `enable_if` otherwise the compiler will try to cast `const void*` to `void*` if we create a buffer with a `const` type

Todo Use `if constexpr` when it is available with C++17

Definition at line 290 of file buffer.hpp.

```
00292                                                {
00293     update_buffer_state(ctx, mode, size, data);
00294   }
```

9.6.2.7.3.5 deallocate_buffer() template<typename T , int Dimensions = 1>

```
void trisycl::detail::buffer< T, Dimensions >::deallocate_buffer ( )  [inline], [private]
```

Deallocate buffer memory if required.

Definition at line 267 of file buffer.hpp.

```
00267                          {
00268     if (allocation)
00269       alloc.deallocate(allocation, mixin::get_count());
00270   }
```

9.6.2.7.3.6 get_destructor_future() template<typename T , int Dimensions = 1> boost::optional< std::future< void > > trisycl::detail::buffer< T, Dimensions >::get_destructor_future ( ) [inline]

Get a `future` to wait from inside the `trisycl::buffer` in case there is something to copy back to the host.

Returns

A `future` in the `optional` if there is something to wait for, otherwise an empty `optional`

Todo Make the function private again

Definition at line 312 of file buffer.hpp.

```
00312                                                   {
00313     /* If there is only 1 shared_ptr user of the buffer, this is the
00314 caller of this function, the \c buffer_waiter, so there is no
00315 need to get a \ future otherwise there will be a dead-lock if
00316 there is only 1 thread waiting for itself.
00317
00318 Since \c use_count() is applied to a \c shared_ptr just created
00319 for this purpose, it actually increase locally the count by 1,
00320 so check for 1 + 1 use count instead...
00321 */
00322     // If the buffer's destruction triggers a write-back, wait
00323     if ((shared_from_this().use_count() > 2) && modified &&
00324         (final_write_back || data_host)) {
00325       // Create a promise to wait for
00326       notify_buffer_destructor = std::promise<void> {};
00327       // And return the future to wait for it
00328       return notify_buffer_destructor->get_future();
00329     }
00330     return boost::none;
00331   }
```

9.6.2.7.3.7 mark_as_written() template<typename T , int Dimensions = 1> void trisycl::detail::buffer< T, Dimensions >::mark_as_written ( ) [inline]

Enforce the buffer to be considered as being modified.

Same as creating an accessor with write access.

Definition at line 186 of file buffer.hpp.

```
00186 { modified = true; }
```

9.6.2.7.3.8 set_final_data() [1/3] template<typename T , int Dimensions = 1> template<typename Iterator , typename ValueType = typename std::iterator_traits<Iterator>::value_type> void trisycl::detail::buffer< T, Dimensions >::set_final_data (Iterator *final_data*) [inline]

Provide destination for write-back on buffer destruction as an iterator.

Definition at line 246 of file buffer.hpp.

```
00246                                        {
00247     /*   using type_ = typename iterator_value_type<Iterator>::value_type;
00248 static_assert(std::is_same<type_, T>::value, "buffer type mismatch");
00249 static_assert(!(std::is_const<type_>::value),
00250 "const iterator is not allowed");*/
00251     // Capture this by reference is enough since the buffer will still exist
00252     final_write_back = [this, final_data = std::move(final_data)] {
00253       std::copy_n(mixin::data(), mixin::get_count(), final_data);
00254     };
00255   }
```

9.6.2.7.3.9 set_final_data() [2/3] template<typename T , int Dimensions = 1>

```
void trisycl::detail::buffer< T, Dimensions >::set_final_data (
            std::nullptr_t  )  [inline]
```

Disable write-back on buffer destruction as an iterator.

Definition at line 238 of file buffer.hpp.

```
00238 { final_write_back = boost::none; }
```

9.6.2.7.3.10 set_final_data() [3/3] template<typename T , int Dimensions = 1>

```
void trisycl::detail::buffer< T, Dimensions >::set_final_data (
            std::weak_ptr< T > final_data )  [inline]
```

Set the weak pointer as destination for write-back on buffer destruction.

Definition at line 227 of file buffer.hpp.

```
00227                                                {
00228     // Capture this by reference is enough since the buffer will still exist
00229     final_write_back = [this, final_data = std::move(final_data)] {
00230       if (auto sptr = final_data.lock()) {
00231         std::copy_n(mixin::data(), mixin::get_count(), sptr.get());
00232       }
00233     };
00234   }
```

9.6.2.7.3.11 track_access_mode() template<typename T , int Dimensions = 1>

```
template<access::mode Mode, access::target Target = access::target::host_buffer>
void trisycl::detail::buffer< T, Dimensions >::track_access_mode ( )  [inline]
```

This method is to be called whenever an accessor is created.

Its current purpose is to track if an accessor with write access is created and acting accordingly.

Definition at line 195 of file buffer.hpp.

```
00195                              {
00196     // test if write access is required
00197     if (Mode == access::mode::write || Mode == access::mode::read_write ||
00198         Mode == access::mode::discard_write ||
00199         Mode == access::mode::discard_read_write ||
00200         Mode == access::mode::atomic) {
00201       modified = true;
00202       if (copy_if_modified) {
00203         // Implement the allocate & copy-on-write optimization
00204         copy_if_modified = false;
00205         // Since the mixin store the geometry, keep a copy before updating
00206         auto current_access = mixin::access;
00207         /* The range is actually computed from \c access itself, so
00208 save it */
00209         auto current_range = mixin::get_range();
00210         allocate_buffer(current_range);
00211         /* Update the mixin accessor to point to the new allocated
00212 memory instead */
00213         mixin::update(allocation, current_range);
00214         // Then copy the read-only data to the new allocated place
00215         std::uninitialized_copy_n(current_access.data_handle(), mixin::get_count(),
00216                                   mixin::data());
00217         /* Now the data of the buffer is no longer backed-up by host
00218 user provided memory */
00219         data_host = false;
00220       }
00221     }
00222   }
```

9.6.2.7.5.1 alloc

```
template<typename T , int Dimensions = 1>
std::allocator<typename mixin::value_type> trisycl::detail::buffer< T, Dimensions >::alloc
[private]
```

The allocator to be used when some memory is needed.

Todo Implement user-provided allocator

Definition at line 55 of file buffer.hpp.

9.6.2.7.5.2 allocation

```
template<typename T , int Dimensions = 1>
mixin::non_const_pointer trisycl::detail::buffer< T, Dimensions >::allocation = nullptr  [private]
```

If some allocation is requested on the host for the buffer memory, this is where the memory is attached to.

Note that this is uninitialized memory, as stated in SYCL specification.

Definition at line 63 of file buffer.hpp.

9.6.2.7.5.3 copy_if_modified

```
template<typename T , int Dimensions = 1>
bool trisycl::detail::buffer< T, Dimensions >::copy_if_modified = false  [private]
```

Track if data should be copied into buffer-owned memory if a modification occurs.

Definition at line 78 of file buffer.hpp.

9.6.2.7.5.4 data_host

```
template<typename T , int Dimensions = 1>
bool trisycl::detail::buffer< T, Dimensions >::data_host = false  [private]
```

Track if the buffer memory is backed by user-provided host memory.

Definition at line 74 of file buffer.hpp.

9.6.2.7.5.5 final_write_back

```
template<typename T , int Dimensions = 1>
boost::optional<std::function<void(void)> > trisycl::detail::buffer< T, Dimensions >::final_write_back [private]
```

How to copy back data on buffer destruction, can be modified with set_final_data(...)

Definition at line 68 of file buffer.hpp.

9.6.2.7.5.6 host_context

```
template<typename T , int Dimensions = 1>
trisycl::context trisycl::detail::buffer< T, Dimensions >::host_context { trisycl::device {} } [private]
```

Track the host context.

Definition at line 84 of file buffer.hpp.

9.6.2.7.5.7 input_shared_pointer

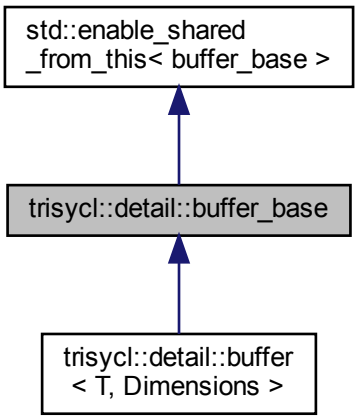
```
template<typename T , int Dimensions = 1>
shared_ptr_class<T> trisycl::detail::buffer< T, Dimensions >::input_shared_pointer [private]
```

Keep the shared pointer used to create the buffer.

Definition at line 71 of file buffer.hpp.

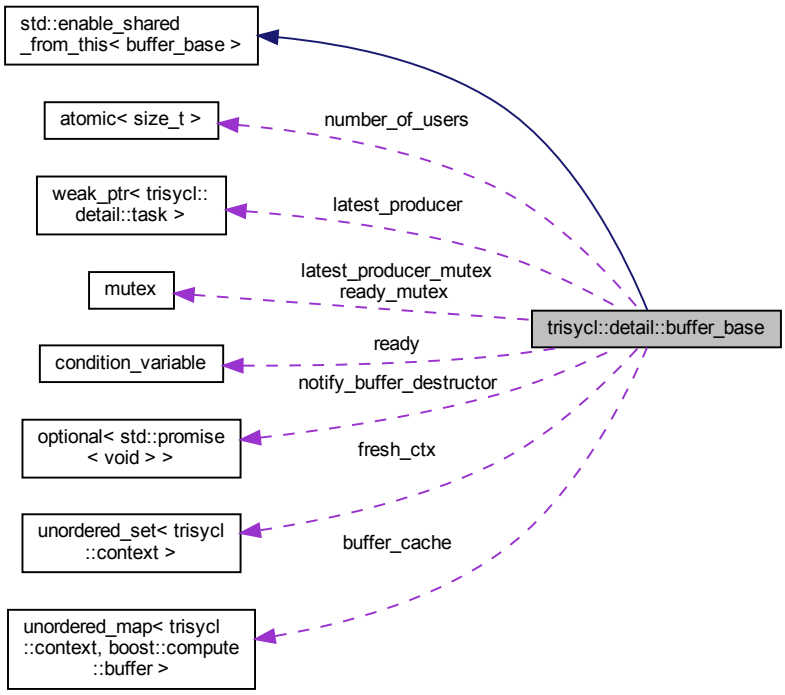
9.6.2.7.5.8 modified

```
template<typename T , int Dimensions = 1>
bool trisycl::detail::buffer< T, Dimensions >::modified = false [private]
```



Definition at line 81 of file buffer.hpp.

9.6.2.8 struct trisycl::detail::buffer_base



Factorize some template independent buffer aspects in a base class.

Definition at line 49 of file buffer_base.hpp.

Inheritance diagram for trisycl::detail::buffer_base:

Collaboration diagram for trisycl::detail::buffer_base:

Public Member Functions

- buffer_base ()

  Create a buffer base and marks the host context as the context that holds the most recent version of the data.
- ~buffer_base ()

  The destructor waits for not being used anymore.
- void wait ()

  Wait for this buffer to be ready, which is no longer in use.
- void use ()

  Mark this buffer in use by a task.
- void release ()

  A task has released the buffer.
- std::shared_ptr< detail::task > get_latest_producer ()

  Return the latest producer for the buffer.
- std::shared_ptr< detail::task > set_latest_producer (std::weak_ptr< detail::task > newer_latest_producer)

  Return the latest producer for the buffer and set another future producer.
- std::shared_ptr< detail::task > add_to_task (handler *command_group_handler, bool is_write_mode)

  Add a buffer to the task running the command group.
- bool is_data_up_to_date (const trisycl::context &ctx)

  Check if the data of this buffer is up-to-date in a certain context.
- bool is_cached (const trisycl::context &ctx)

  Check if the buffer is already cached for a certain context.
- void create_in_cache (const trisycl::context &ctx, size_t size, cl_mem_flags flags, void *data)

Create a `boost::compute::buffer` for this `trisycl::buffer` in the cache and associate it with a given context.

- void sync_with_host (std::size_t size, void *data)

  Transfer the most up-to-date version of the data to the host if the host version is not already up-to-date.

- void update_buffer_state (const trisycl::context &target_ctx, access::mode mode, std::size_t size, void *data)

  When a transfer is requested this function is called, it will update the state of the buffer according to the context in which the accessor is created and the access mode.

- boost::compute::buffer get_cl_buffer (const trisycl::context &context)

  Returns the cl_buffer for a given context.

Public Attributes

- std::atomic< size_t > number_of_users
- std::weak_ptr< detail::task > latest_producer

  Track the latest task to produce this buffer.

- std::mutex latest_producer_mutex

  To protect the access to latest_producer.

- std::condition_variable ready

  To signal when this buffer ready.

- std::mutex ready_mutex

  To protect the access to the condition variable.

- boost::optional< std::promise< void > > notify_buffer_destructor

  If the SYCL user buffer destructor is blocking, use this to block until this buffer implementation is destroyed.

- std::unordered_set< trisycl::context > fresh_ctx

  To track contexts in which the data is up-to-date.

- std::unordered_map< trisycl::context, boost::compute::buffer > buffer_cache

  Buffer-side cache that keeps the `boost::compute::buffer` (and the underlying `cl_buffer`) so that if the buffer already exists inside the same context it is not recreated.

9.6.2.8.1 Constructor & Destructor Documentation

9.6.2.8.1.1 buffer_base() `trisycl::detail::buffer_base::buffer_base ( ) [inline]`

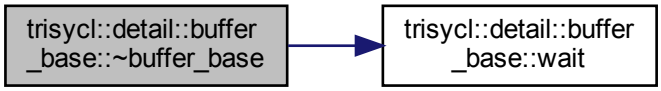
Create a buffer base and marks the host context as the context that holds the most recent version of the data.

Todo Use lazy allocation for the context tracking set

Definition at line 86 of file buffer_base.hpp.

```
00086                 :  number_of_users { 0 },
00087                   fresh_ctx { trisycl::context {} } {}
```

9.6.2.8.1.2 ~buffer_base() trisycl::detail::buffer_base::~buffer_base ( ) [inline]



The destructor waits for not being used anymore.

Definition at line 91 of file buffer_base.hpp.

```
00091                 {
00092     wait();
00093     // If there is the last SYCL user buffer waiting, notify it
00094     if (notify_buffer_destructor)
00095       notify_buffer_destructor->set_value();
00096   }
```

References notify_buffer_destructor, and wait().

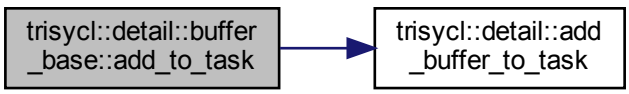
9.6.2.8.2 Member Function Documentation

9.6.2.8.2.1 add_to_task() std::shared_ptr< detail::task > trisycl::detail::buffer_base::add_↩ to_task (handler * command_group_handler, bool is_write_mode) [inline]



Add a buffer to the task running the command group.

Definition at line 153 of file buffer_base.hpp.

```
00153                                                                    {
00154     return add_buffer_to_task(command_group_handler,
00155                               shared_from_this(),
00156                               is_write_mode);
00157   }
```

References trisycl::detail::add_buffer_to_task().

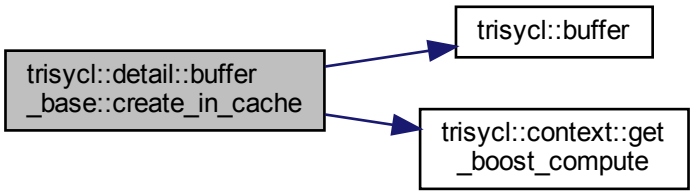
9.6.2.8.2.2 create_in_cache()

```
void trisycl::detail::buffer_base::create_in_cache (
    const trisycl::context & ctx,
    size_t size,
    cl_mem_flags flags,
    void * data )  [inline]
```

Create a `boost::compute::buffer` for this `trisycl::buffer` in the cache and associate it with a given context.



Definition at line 176 of file buffer_base.hpp.

```
00177                                                    {
00178     buffer_cache[ctx] = boost::compute::buffer
00179       { ctx.get_boost_compute(),
00180         size,
00181         flags,
00182         data
00183       };
00184   }
```

9.6.2.8.3 Member Data Documentation

9.6.2.8.3.1 buffer_cache `std::unordered_map<trisycl::context, boost::compute::buffer> trisycl↩ ::detail::buffer_base::buffer_cache`

Buffer-side cache that keeps the `boost::compute::buffer` (and the underlying `cl_buffer`) so that if the buffer already exists inside the same context it is not recreated.

Definition at line 79 of file buffer_base.hpp.

Referenced by create_in_cache(), get_cl_buffer(), is_cached(), sync_with_host(), and update_buffer_state().

9.6.2.8.3.2 fresh_ctx `std::unordered_set<trisycl::context> trisycl::detail::buffer_base::fresh↩ _ctx`

To track contexts in which the data is up-to-date.

Definition at line 72 of file buffer_base.hpp.

Referenced by is_data_up_to_date(), sync_with_host(), and update_buffer_state().

9.6.2.8.3.3 latest_producer `std::weak_ptr<detail::task> trisycl::detail::buffer_base::latest_producer`

Track the latest task to produce this buffer.

Definition at line 55 of file buffer_base.hpp.

Referenced by get_latest_producer(), and set_latest_producer().

9.6.2.8.3.4 latest_producer_mutex `std::mutex trisycl::detail::buffer_base::latest_producer_mutex`

To protect the access to latest_producer.

Definition at line 57 of file buffer_base.hpp.

Referenced by get_latest_producer(), and set_latest_producer().

9.6.2.8.3.5 notify_buffer_destructor `boost::optional<std::promise<void> > trisycl::detail::buffer_base::notify_buffer_destructor`

If the SYCL user buffer destructor is blocking, use this to block until this buffer implementation is destroyed.

Use a void promise since there is no value to send, only waiting

Definition at line 69 of file buffer_base.hpp.

Referenced by ~buffer_base().

9.6.2.8.3.6 number_of_users `std::atomic<size_t> trisycl::detail::buffer_base::number_of_users`

Definition at line 52 of file buffer_base.hpp.

Referenced by release(), use(), and wait().

9.6.2.8.3.7 ready `std::condition_variable trisycl::detail::buffer_base::ready`

To signal when this buffer ready.

Definition at line 60 of file buffer_base.hpp.

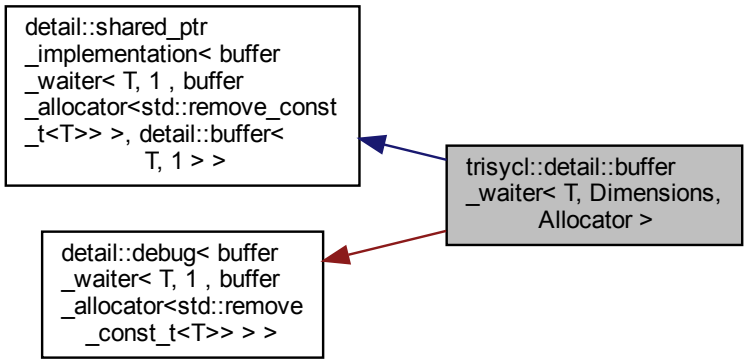
Referenced by release(), and wait().

9.6.2.8.3.8 ready_mutex `std::mutex trisycl::detail::buffer_base::ready_mutex`

To protect the access to the condition variable.

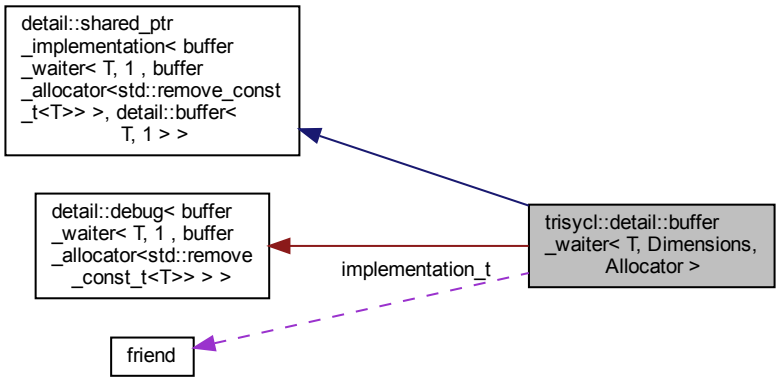
Definition at line 62 of file buffer_base.hpp.

Referenced by release(), and wait().



9.6.2.9 class trisycl::detail::buffer_waiter

template<typename T, int Dimensions = 1, typename Allocator = buffer_allocator<std::remove_const_t<T>>>
class trisycl::detail::buffer_waiter< T, Dimensions, Allocator >



A helper class to wait for the final buffer destruction if the conditions for blocking are met.

Definition at line 31 of file buffer_waiter.hpp.

Inheritance diagram for trisycl::detail::buffer_waiter< T, Dimensions, Allocator >:

Collaboration diagram for trisycl::detail::buffer_waiter< T, Dimensions, Allocator >:

Public Member Functions

- buffer_waiter (detail::buffer< T, Dimensions > *b)

  Create a new buffer_waiter on top of a detail::buffer.
- ~buffer_waiter ()

  The buffer_waiter destructor waits for any data to be written back to the host, if any.

Private Types

- using implementation_t = typename buffer_waiter::shared_ptr_implementation

Private Attributes

- friend implementation_t

Definition at line 39 of file buffer_waiter.hpp.

9.6.2.9.2 Constructor & Destructor Documentation

9.6.2.9.2.1 buffer_waiter() `template<typename T , int Dimensions = 1, typename Allocator = buffer_allocator<std::remove_const_t<T>>>`

`trisycl::detail::buffer_waiter< T, Dimensions, Allocator >::buffer_waiter ( detail::buffer< T, Dimensions > * b ) [inline]`

Create a new buffer_waiter on top of a detail::buffer.

Definition at line 50 of file buffer_waiter.hpp.

```
00050 : implementation_t { b } {}
```

9.6.2.9.2.2 ~buffer_waiter() `template<typename T , int Dimensions = 1, typename Allocator = buffer_allocator<std::remove_const_t<T>>>`

`trisycl::detail::buffer_waiter< T, Dimensions, Allocator >::~buffer_waiter ( ) [inline]`

The buffer_waiter destructor waits for any data to be written back to the host, if any.

Definition at line 56 of file buffer_waiter.hpp.

```
00056                   {
00057     /* Get a future from the implementation if we have to wait for its
00058 destruction */
00059     auto f = implementation->get_destructor_future();
00060     if (f) {
00061       /* No longer carry for the implementation buffer which is free to
00062 live its life up to its destruction */
00063       implementation.reset();
00064       TRISYCL_DUMP_T("~buffer_waiter() is waiting");
00065       // Then wait for its end in some other thread
00066       f->wait();
00067       TRISYCL_DUMP_T("~buffer_waiter() is done");
00068     }
00069   }
```

References TRISYCL_DUMP_T.

9.6.2.9.3 Member Data Documentation

9.6.2.9.3.1 implementation_t `template<typename T , int Dimensions = 1, typename Allocator = buffer_allocator<std::remove_const_t<T>>>`

`friend trisycl::detail::buffer_waiter< T, Dimensions, Allocator >::implementation_t [private]`

Definition at line 42 of file buffer_waiter.hpp.

9.6.2.10 struct trisycl::image

template<int Dimensions>
struct trisycl::image< Dimensions >

Todo implement image

Definition at line 22 of file image.hpp.

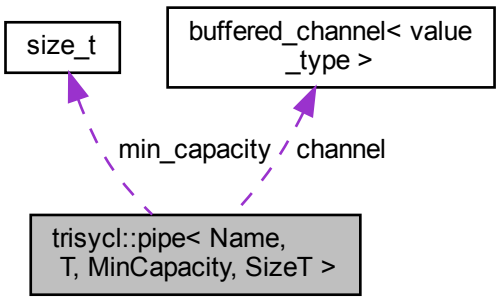
9.6.2.11 class trisycl::pipe

template<typename Name, typename T, std::size_t MinCapacity = 0, typename SizeT = std::size_t>
class trisycl::pipe< Name, T, MinCapacity, SizeT >

SYCL pipe object.

The member functions can throw for now to help debugging or implementation on CPU.

This is mainly a CPU implementation of the Intel extension described in



- https://github.com/intel/llvm/pull/292
- https://github.com/intel/llvm/pull/635
- https://github.com/intel/llvm/issues/832

Todo Bike-shed the naming & API according to current C++ proposals or libraries about static sized FIFO

This could be implemented on top of https://xilinx.github.io/XRT/master/html/streaming_data_support.html and/or expose some features from XRT

Definition at line 47 of file pipe.hpp.

Collaboration diagram for trisycl::pipe< Name, T, MinCapacity, SizeT >:

Public Types

- using value_type = T
- using size_type = SizeT

Static Public Member Functions

- static value_type read ()

  Blocking read from the pipe.
- static void write (const value_type &value)

  Blocking write to the pipe.
- static value_type read (bool &success_code)

  Non-blocking read from the pipe.
- static void write (const value_type &data, bool &success_code)

  Non-blocking write to the pipe.

Static Public Attributes

- static constexpr SizeT min_capacity = bit_ceil_at_least_2(MinCapacity)

  The minimum capacity in value_type of this pipe.

Static Private Member Functions

- static constexpr std::size_t bit_ceil_at_least_2 (std::size_t value)

  Finds the smallest integral power of two not less than the given value but at least 2 to fit the requirement from boost::fibers::buffered_channel.

Static Private Attributes

- static boost::fibers::buffered_channel< value_type > channel { min_capacity }

  A FIFO used to implement the pipe.

9.6.2.11.1 Member Typedef Documentation

9.6.2.11.1.1 size_type

```
template<typename Name , typename T , std::size_t MinCapacity = 0, typename
SizeT = std::size_t>
using trisycl::pipe< Name, T, MinCapacity, SizeT >::size_type = SizeT
```

Definition at line 73 of file pipe.hpp.

9.6.2.11.1.2 value_type

```
template<typename Name , typename T , std::size_t MinCapacity = 0,
typename SizeT = std::size_t>
using trisycl::pipe< Name, T, MinCapacity, SizeT >::value_type = T
```

Definition at line 65 of file pipe.hpp.

9.6.2.11.2 Member Function Documentation

9.6.2.11.2.1 bit_ceil_at_least_2() `template<typename Name , typename T , std::size_t MinCapacity = 0, typename SizeT = std::size_t>`

```
static constexpr std::size_t trisycl::pipe< Name, T, MinCapacity, SizeT >::bit_ceil_at_least_2 (
              std::size_t value )  [inline], [static], [constexpr], [private]
```

Finds the smallest integral power of two not less than the given value but at least 2 to fit the requirement from boost::fibers::buffered_channel.

Todo At some point use C++20 std::bit_ceil instead of this DIY function

Definition at line 55 of file pipe.hpp.

```
00055                                                                    {
00056     std::size_t result = 2;
00057     while (value > result)
00058       result *= 2;
00059     return result;
00060   }
```

9.6.2.11.2.2 read() [1/2] `template<typename Name , typename T , std::size_t MinCapacity = 0, typename SizeT = std::size_t>`

```
static value_type trisycl::pipe< Name, T, MinCapacity, SizeT >::read ( )  [inline], [static]
```

Blocking read from the pipe.

Returns

the value

Definition at line 87 of file pipe.hpp.

```
00087                           {
00088     return channel.value_pop();
00089   }
```

References trisycl::pipe< Name, T, MinCapacity, SizeT >::channel.

9.6.2.11.2.3 read() [2/2] `template<typename Name , typename T , std::size_t MinCapacity = 0, typename SizeT = std::size_t>`

```
static value_type trisycl::pipe< Name, T, MinCapacity, SizeT >::read (
              bool & success_code )  [inline], [static]
```

Non-blocking read from the pipe.

Parameters

out	*success_code*	is true iff the read was successful

Returns

the value read from the pipe or the default one

Definition at line 107 of file pipe.hpp.

```
00107                                                {
00108     value_type value;
00109     success_code =
00110       channel.try_pop(value) == boost::fibers::channel_op_status::success;
00111     /* The current API might be inefficient if we copy always value back.
00112 But we should have a copy elision...  */
00113     return value;
00114   }
```

References trisycl::pipe< Name, T, MinCapacity, SizeT >::channel.

```
static void trisycl::pipe< Name, T, MinCapacity, SizeT >::write (
              const value_type & data,
              bool & success_code )  [inline], [static]
```

Non-blocking write to the pipe.

Parameters

out	*success_code*	is true iff the read was successful

Returns

the value read from the pipe or the default one

Definition at line 123 of file pipe.hpp.

```
00123                                                                {
00124       success_code =
00125         channel.try_push(data) != boost::fibers::channel_op_status::full;
00126   }
```

References trisycl::pipe< Name, T, MinCapacity, SizeT >::channel.

9.6.2.11.2.5 write() [2/2] template<typename Name , typename T , std::size_t MinCapacity = 0, typename SizeT = std::size_t>

```
static void trisycl::pipe< Name, T, MinCapacity, SizeT >::write (
              const value_type & value )  [inline], [static]
```

Blocking write to the pipe.

Parameters

in	*value*	is the data to send to the pipe

Definition at line 96 of file pipe.hpp.

```
00096                                           {
00097     channel.push(value);
00098   }
```

References trisycl::pipe< Name, T, MinCapacity, SizeT >::channel.

9.6.2.11.3 Member Data Documentation

9.6.2.11.3.1 channel `template<typename Name , typename T , std::size_t MinCapacity = 0, typename SizeT = std::size_t>`
`boost::fibers::buffered_channel<value_type> trisycl::pipe< Name, T, MinCapacity, SizeT >::channel { min_capacity }  [inline], [static], [private]`

A FIFO used to implement the pipe.

Definition at line 79 of file pipe.hpp.

Referenced by trisycl::pipe< Name, T, MinCapacity, SizeT >::read(), and trisycl::pipe< Name, T, MinCapacity, SizeT >::write().

9.6.2.11.3.2 min_capacity `template<typename Name , typename T , std::size_t MinCapacity = 0, typename SizeT = std::size_t>`
`constexpr SizeT trisycl::pipe< Name, T, MinCapacity, SizeT >::min_capacity = bit_ceil_at_least_2(MinCapacity)  [static], [constexpr]`

The minimum capacity in value_type of this pipe.

The underlying implementation requires a power of 2

Definition at line 70 of file pipe.hpp.

9.6.3 Typedef Documentation

9.6.3.1 buffer_allocator

```
template<typename T >
using trisycl::buffer_allocator = typedef std::allocator<T>
```

`#include <include/triSYCL/allocator.hpp>`

The allocator objects give the programmer some control on how the memory is allocated inside SYCL.

The default buffer allocator used by the runtime, when no allocator is defined by the user.

The allocator used for the `buffer` inside SYCL

Just use the default allocator for now.

Reuse the C++ default allocator.

Definition at line 29 of file allocator.hpp.

9.6.3.2 image_allocator

```
template<typename T >
using trisycl::image_allocator = typedef std::allocator<T>
```

`#include <include/triSYCL/allocator.hpp>`

The allocator used for the `image` inside SYCL.

Just use the default allocator for now.

Definition at line 37 of file allocator.hpp.

9.6.3.3 map_allocator

```
template<typename T >
using trisycl::map_allocator = typedef std::allocator<T>
```

`#include <include/triSYCL/allocator.hpp>`

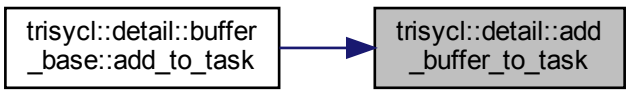
The allocator used to map the memory at the same place.

Just use the default allocator for now.

Todo : implement and clarify the specification. It looks like it is not really an allocator according the current spec

Definition at line 48 of file allocator.hpp.

9.6.4 Function Documentation



9.6.4.1 add_buffer_to_task()

```
static std::shared_ptr< detail::task > trisycl::detail::add_buffer_to_task (
            handler * command_group_handler,
            std::shared_ptr< detail::buffer_base > b,
            bool is_write_mode )  [inline], [static]
```

`#include <include/triSYCL/buffer/detail/buffer_base.hpp>`

Referenced by trisycl::detail::buffer_base::add_to_task().

Here is the caller graph for this function:

9.6.4.2 buffer() [1/2]

```
trisycl::buffer (
            auto & host_data ) -> buffer< std::ranges::range_value_t< decltype(host_data)>,
1 >
```

`#include <include/triSYCL/buffer.hpp>`

A deduction guide to infer the buffer type from the read-write range.

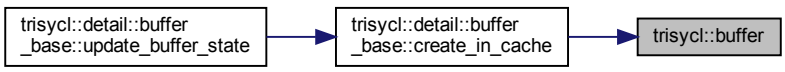
Todo Use some standard concepts

Todo Add this to SYCL Next

9.6.4.3 buffer() [2/2]

```
template<std::forward_iterator FIB, std::forward_iterator FIE>
trisycl::buffer (
            FIB begin,
            FIE end ) -> buffer< typename std::iterator_traits< FIB >::value_type, 1 >
```

`#include <include/triSYCL/buffer.hpp>`



A deduction guide to infer the buffer type from the read-write forward iterators into a copy-in on construction and copy-back on destruction.

Todo Use some standard concepts

Todo Add this to SYCL Next

Referenced by trisycl::detail::buffer_base::create_in_cache().

Here is the caller graph for this function:

9.6.4.4 buffer_add_to_task()

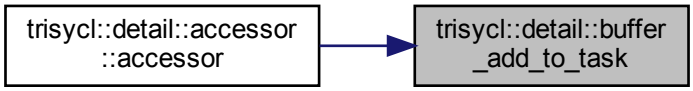
```
template<typename BufferDetail >
static std::shared_ptr< detail::task > trisycl::detail::buffer_add_to_task (
            BufferDetail buf,
            handler * command_group_handler,
            bool is_write_mode )  [static]
```

`#include <include/triSYCL/buffer/detail/buffer.hpp>`

Proxy function to avoid some circular type recursion.

Returns

a shared_ptr<task>



Todo To remove with some refactoring

Definition at line 352 of file buffer.hpp.

```
00353                                        {
00354   return buf->add_to_task(command_group_handler, is_write_mode);
00355 }
```

Referenced by trisycl::detail::accessor< T, Dimensions, Mode, Target >::accessor().

Here is the caller graph for this function:

9.6.4.5 waiter()

```
template<typename T , int Dimensions = 1, typename Allocator = buffer_allocator<std::remove_↩
const_t<T>>>
auto trisycl::detail::waiter (
            detail::buffer< T, Dimensions > * b )  [inline]
```

`#include <include/triSYCL/buffer/detail/buffer_waiter.hpp>`

Helper function to create a new buffer_waiter.

Definition at line 77 of file buffer_waiter.hpp.

```
00077                                                {
00078   return new buffer_waiter<T, Dimensions, Allocator> { b };
00079 }
```

Collaboration diagram for trisycl::vendor::trisycl::scope::device< DeviceStorage, ScopedPlatform >:

Public Types

- using storage_type = DeviceStorage

  The type of the scoped storage in the device.
- using device_scope_type = storage_type

  The device scope storage type.
- using platform_type = ScopedPlatform

  The platform type targeted by this queue.
- using platform_scope_type = detail::storage_type_trait_t< platform_type >

  The platform scope storage type.
- using storage_type = DeviceStorage

  The type of the scoped storage in the device.
- using device_scope_type = storage_type

  The device scope storage type.
- using platform_type = ScopedPlatform

  The platform type targeted by this queue.
- using platform_scope_type = detail::storage_type_trait_t< platform_type >

  The platform scope storage type.

Public Member Functions

- device (const ::trisycl::device &d, const ScopedPlatform &p={})

  Construct the device with some device-scoped storage on top of a SYCL device.
- device ()

  By default use the default (host) device with no platform storage.
- device (const device &)=default

  It is still copyable.

- device (device &&)=default

  It is still movable.
- auto & get_storage () const

  Access to the device-scoped storage.
- auto & get_platform () const

  Access to the underlying scoped platform.
- operator::trisycl::device & () const

  Add a conversion to `trisycl::device&` so it can be used as a normal device.
- device (const ::trisycl::device &d, const ScopedPlatform &p={})

  Construct the device with some device-scoped storage on top of a SYCL device.
- device ()

  By default use the default (host) device with no platform storage.
- device (const device &)=default

  It is still copyable.
- device (device &&)=default

  It is still movable.
- auto & get_storage () const

  Access to the device-scoped storage.
- auto & get_platform () const

  Access to the underlying scoped platform.
- operator::trisycl::device & () const

  Add a conversion to `trisycl::device&` so it can be used as a normal device.

Public Attributes

- std::shared_ptr< Implementation > implementation

  The implementation forward everything to this... implementation.
- std::shared_ptr< Implementation > implementation

  The implementation forward everything to this... implementation.

Static Public Attributes

- static constexpr bool has_some_storage_p

  True if there is some storage in the device.

Private Types

9.7.2.5.3.1 get_storage() [1/2] template<typename PlatformStorage = empty_platform_scope> auto & trisycl::vendor::trisycl::scope::platform< PlatformStorage >::get_storage ( ) const [inline]

Access to the platform-scoped storage.

Definition at line 97 of file platform.hpp.

```
00097                                {
00098     return implementation->get_storage();
00099   }
```

9.7.2.5.3.2 get_storage() [2/2] template<typename PlatformStorage = empty_platform_scope> auto & trisycl::vendor::trisycl::scope::platform< PlatformStorage >::get_storage ( ) const [inline]

Access to the platform-scoped storage.

Definition at line 97 of file platform.hpp.

```
00097                                {
00098     return implementation->get_storage();
00099   }
```

9.7.2.5.3.3 operator::trisycl::platform &() [1/2]

template<typename PlatformStorage = empty_platform_scope>
trisycl::vendor::trisycl::scope::platform< PlatformStorage >::operator::trisycl::platform & ( ) const [inline]

Add a conversion to `trisycl::platform&` so it can be used as a normal platform.

Definition at line 104 of file platform.hpp.

```
00104                                   {
00105       return implementation->get_underlying_platform();
00106     }
```

9.7.2.5.3.4 operator::trisycl::platform &() [2/2]

template<typename PlatformStorage = empty_platform_scope>
trisycl::vendor::trisycl::scope::platform< PlatformStorage >::operator::trisycl::platform & ( ) const [inline]

Add a conversion to `trisycl::platform&` so it can be used as a normal platform.

Definition at line 104 of file platform.hpp.

```
00104                                   {
00105       return implementation->get_underlying_platform();
00106     }
```

9.7.2.5.4 Member Data Documentation

9.7.2.5.4.1 has_some_storage_p

template<typename PlatformStorage = empty_platform_scope>
constexpr bool trisycl::vendor::trisycl::scope::platform< PlatformStorage >::has_some_storage_p [static], [constexpr]

Initial value:

```
=
    not std::is_same_v<PlatformStorage, empty_platform_scope>
```

True if there is some storage in the platform.

Definition at line 70 of file platform.hpp.

9.7.2.5.4.2 implementation [1/2]

template<typename PlatformStorage = empty_platform_scope>
std::shared_ptr<Implementation> trisycl::detail::shared_ptr_implementation< Parent, Implementation >::implementation

The implementation forward everything to this... implementation.

Definition at line 41 of file shared_ptr_implementation.hpp.

9.7.2.5.4.3 implementation [2/2] template<typename PlatformStorage = empty_platform_scope> std::shared_ptr<Implementation> trisycl::detail::shared_ptr_implementation< Parent, Implementation >::implementation

The implementation forward everything to this... implementation.

Definition at line 41 of file shared_ptr_implementation.hpp.

9.7.2.6.3.1 p `template<typename PlatformStorage >`

`::trisycl::platform trisycl::vendor::trisycl::scope::detail::platform< PlatformStorage >::p`

`[private]`

The storage-less platform behind the scene.

Definition at line 28 of file platform.hpp.

Referenced by trisycl::vendor::trisycl::scope::detail::platform< PlatformStorage >::get_underlying_platform().

9.7.2.6.3.2 scope_storage `template<typename PlatformStorage >`

`PlatformStorage trisycl::vendor::trisycl::scope::detail::platform< PlatformStorage >::scope_storage [private]`

The platform-scoped storage default-initialized.

Todo For now it is allocated on the host in this CPU emulation but a device compiler and run time can create this on a real device

Todo For now it is allocated on the host in this CPU emulation but a device compiler and run time can create this on a real device

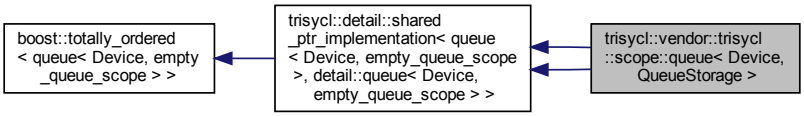
Definition at line 36 of file platform.hpp.

Referenced by trisycl::vendor::trisycl::scope::detail::platform< PlatformStorage >::get_storage().

9.7.2.7 struct trisycl::vendor::trisycl::scope::empty_queue_scope

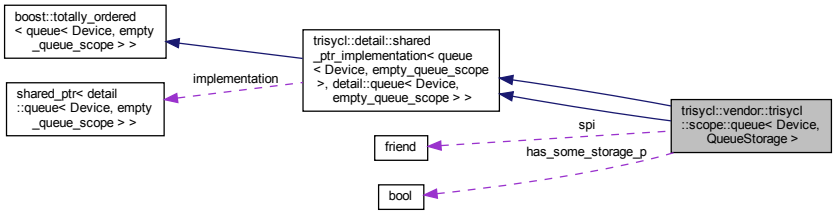
An empty queue scope to make compilation errors clearer.

Definition at line 36 of file queue.hpp.



9.7.2.8 class trisycl::vendor::trisycl::scope::queue

template<typename Device, typename QueueStorage = empty_queue_scope>
class trisycl::vendor::trisycl::scope::queue< Device, QueueStorage >



A conceptual queue implementing some queue-scoped storage constructed from a device with some device-scope storage.

Definition at line 45 of file queue.hpp.

Inheritance diagram for trisycl::vendor::trisycl::scope::queue< Device, QueueStorage >:

Collaboration diagram for trisycl::vendor::trisycl::scope::queue< Device, QueueStorage >:

Public Types

- using storage_type = QueueStorage

  The type of the scoped storage in the queue.
- using device_type = Device

  The device type targeted by this queue.
- using platform_type = typename device_type::platform_type

  The platform type targeted by this queue.
- using queue_scope_type = storage_type

  The queue scope storage type.
- using device_scope_type = detail::storage_type_trait_t< device_type >

  The device scope storage type.
- using platform_scope_type = detail::storage_type_trait_t< platform_type >

  The platform scope storage type.
- using storage_type = QueueStorage

  The type of the scoped storage in the queue.
- using device_type = Device

The device type targeted by this queue.

- using platform_type = typename device_type::platform_type

  The platform type targeted by this queue.
- using queue_scope_type = storage_type

  The queue scope storage type.
- using device_scope_type = detail::storage_type_trait_t< device_type >

  The device scope storage type.
- using platform_scope_type = detail::storage_type_trait_t< platform_type >

  The platform scope storage type.

Public Member Functions

- queue (const ::trisycl::queue &q, const Device &d)

  Construct the queue with some queue-scoped storage on top of a SYCL queue.
- queue (const Device &d)

  Construct the queue with some queue-scoped storage on top of a scoped device.
- queue (const queue &)=default

  It is still copyable.
- queue (queue &&)=default

  It is still movable.
- auto & get_storage () const

  Access to the queue-scoped storage.
- auto & get_device () const

  Access to the underlying scoped device.
- auto & get_platform () const

  Access to the underlying scoped platform.
- auto & device_scope ()

  Provide access to the device scope from the host.
- template<typename PS = platform_type, typename E = std::enable_if_t<PS::has_some_storage_p>>
  auto & platform_scope ()

  Provide access to the platform scope from the host, if any.
- operator::trisycl::queue & () const

  Add a conversion to `trisycl::queue&` so it can be used as a normal queue.
- template<typename CG >
  void submit (CG cgh)

  Submit a command-group lambda function.
- void wait ()

  Performs a blocking wait for the completion all enqueued tasks in the queue.
- queue (const ::trisycl::queue &q, const Device &d)

  Construct the queue with some queue-scoped storage on top of a SYCL queue.
- queue (const Device &d)

  Construct the queue with some queue-scoped storage on top of a scoped device.
- queue (const queue &)=default

  It is still copyable.

9.8.1 Detailed Description

9.8.2 Class Documentation

9.8.2.1 struct trisycl::vendor::xilinx::partition_array

template<typename ValueType, std::size_t Size, typename PartitionType = partition::none>
struct trisycl::vendor::xilinx::partition_array< ValueType, Size, PartitionType >

Define an array class with partition feature.

Since on FPGA, users can customize the memory architecture in the system and within the CU. Array partition help us to partition single array to multiple memories that can be accessed simultaneously getting higher memory bandwidth.

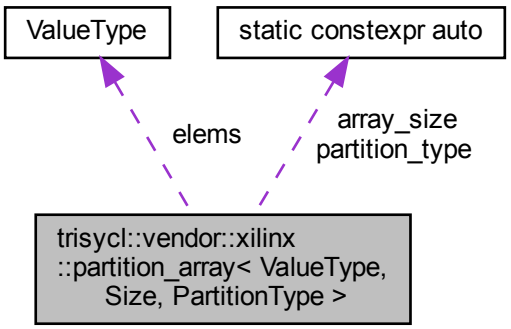
Parameters

ValueType	is the type of element.
Size	is the size of the array.
PartitionType	is the array partition type: cyclic, block, and complete. The default type is none.

Todo Deal with multi-dimension array.

Since on FPGA, users can customize the memory architecture in the system and within the CU. Array partition

help us to partition single array to multiple memories that can be accessed simultaneously getting higher memory bandwidth.



Parameters

ValueType	is the type of element.
Size	is the size of the array.
PartitionType	is the array partition type: cyclic, block, and complete. The default type is none.

Todo Deal with multi-dimension array.

Definition at line 154 of file partition_array.hpp.

Collaboration diagram for trisycl::vendor::xilinx::partition_array< ValueType, Size, PartitionType >:

Public Types

- using element_type = ValueType
  Type of array elements.
- using element_type = ValueType
  Type of array elements.

Public Member Functions

- auto begin ()
  Provide iterator.
- const auto begin () const
- auto end ()
- const auto end () const
- constexpr auto size () const noexcept
  Evaluate size.
- partition_array ()
  Construct an array.

- template<typename SomeContainer >
  partition_array (const SomeContainer &src)

  A constructor from some container.
- template<typename SourceBasicType , typename = std::enable_if_t<std::is_convertible<SourceBasicType, ValueType>::value>>
  constexpr partition_array (std::initializer_list< SourceBasicType > l)

  Construct an array from initializer_list.
- constexpr ValueType & operator[ ] (std::size_t i)

  Provide a subscript operator.
- constexpr const ValueType & operator[ ] (std::size_t i) const
- constexpr auto get_partition_type () const

  Return the partition type of the array.
- auto begin ()

  Provide iterator.
- const auto begin () const
- auto end ()
- const auto end () const
- constexpr auto size () const noexcept

  Evaluate size.
- partition_array ()

  Construct an array.
- template<typename SomeContainer >
  partition_array (const SomeContainer &src)

  A constructor from some container.
- template<typename SourceBasicType , typename = std::enable_if_t<std::is_convertible<SourceBasicType, ValueType>::value>>
  constexpr partition_array (std::initializer_list< SourceBasicType > l)

  Construct an array from initializer_list.
- constexpr ValueType & operator[ ] (std::size_t i)

  Provide a subscript operator.
- constexpr const ValueType & operator[ ] (std::size_t i) const
- constexpr auto get_partition_type () const

  Return the partition type of the array.

Public Attributes

- ValueType elems [Size]

  Store the array elements.

Static Public Attributes

- static constexpr auto array_size = Size

  The number of elements of the 1-D array.
- static constexpr auto partition_type = PartitionType::partition_type

  The kind of partitioning.

9.8.2.1.1 Member Typedef Documentation

9.8.2.1.1.1 element_type [1/2]

```
template<typename ValueType , std::size_t Size, typename Partition↩
Type = partition::none>
using trisycl::vendor::xilinx::partition_array< ValueType, Size, PartitionType >::element_type
= ValueType
```

Type of array elements.

Functions

- template<typename Accessor >
  static auto & trisycl::get_pipe_detail (Accessor &a)

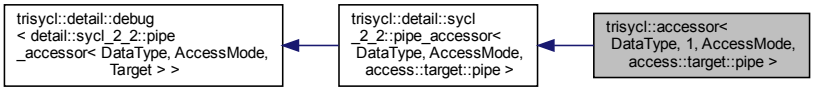
  Top-level function to break circular dependencies on the the types to get the pipe implementation.

9.9.1 Detailed Description

9.9.2 Class Documentation

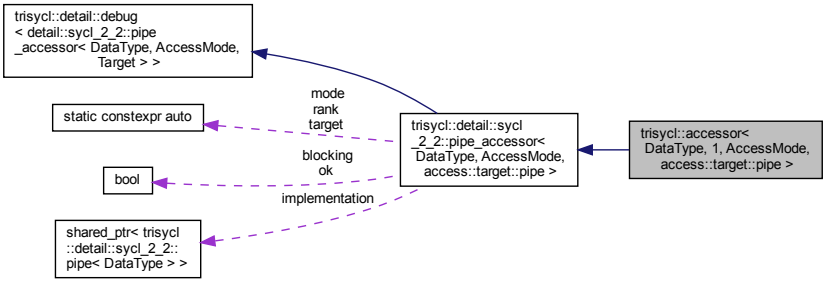
9.9.2.1 class trisycl::accessor< DataType, 1, AccessMode, access::target::pipe >

template<typename DataType, access::mode AccessMode>
class trisycl::accessor< DataType, 1, AccessMode, access::target::pipe >



The pipe accessor abstracts the way pipe data are accessed inside a kernel.

This is a proposal for the now abandoned SYCL 2.2 provisional specification. This is still here for historical reasons.



A specialization for an non-blocking pipe

Definition at line 402 of file accessor.hpp.

Inheritance diagram for trisycl::accessor< DataType, 1, AccessMode, access::target::pipe >:

Collaboration diagram for trisycl::accessor< DataType, 1, AccessMode, access::target::pipe >:

Public Types

- using accessor_detail = detail::sycl_2_2::pipe_accessor< DataType, AccessMode, access::target::pipe >

Public Member Functions

- accessor (sycl_2_2::pipe< DataType > &p, handler &command_group_handler)

  Construct a pipe accessor from a pipe using a command group handler object from the command group scope.
- sycl_2_2::pipe_reservation< accessor > reserve (std::size_t size) const

  Make a reservation inside the pipe.
- auto & get_pipe_detail ()

  Get the underlying pipe implementation.

```

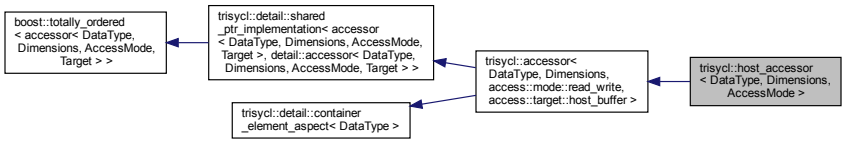
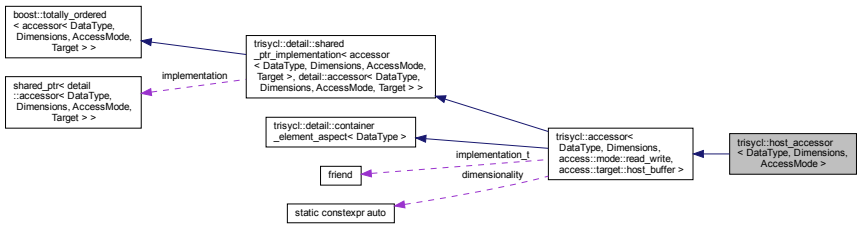
9.9.2.3 class trisycl::host_accessor

template<typename DataType, int Dimensions, access::mode AccessMode = access::mode::read_write>
class trisycl::host_accessor< DataType, Dimensions, AccessMode >



SYCL 2020 host_accessor.

Parameters



in	*DataType*	is the value type of the elements
in	*Dimensions*	is the rank of the accessor
in	*AccessMode*	precises whether the access is done in read or write mode. By default this is read+write

Definition at line 499 of file accessor.hpp.

Inheritance diagram for trisycl::host_accessor< DataType, Dimensions, AccessMode >:

Collaboration diagram for trisycl::host_accessor< DataType, Dimensions, AccessMode >:

Public Member Functions

- template<typename Allocator >
  host_accessor (buffer< DataType, Dimensions, Allocator > &target_buffer)

  Create an accessor to a buffer to access from the host.
- template<typename Allocator >
  accessor (buffer< DataType, Dimensions, Allocator > &target_buffer, handler &command_group_handler)

  Construct a buffer accessor from a buffer using a command group handler object from the command group scope.
- template<typename Allocator >
  accessor (buffer< DataType, Dimensions, Allocator > &target_buffer)

  Construct a buffer accessor from a buffer.
- template<typename Allocator >
  accessor (buffer< DataType, Dimensions, Allocator > &target_buffer, handler &command_group_handler, const range< Dimensions > &offset, const range< Dimensions > &range)

  Construct a buffer accessor from a buffer given a specific range for access permissions and an offset that provides the starting point for the access range using a command group handler object from the command group scope.
- accessor (const range< Dimensions > &allocation_size, handler &command_group_handler)

  Construct an accessor of dimension Dimensions with elements of type DataType using the passed range to specify the size in each dimension.

Private Types

- using base = accessor< DataType, Dimensions, AccessMode, access::target::host_buffer >

Additional Inherited Members

9.9.2.3.1 Member Typedef Documentation

9.9.2.3.1.1 base

```
template<typename DataType , int Dimensions, access::mode AccessMode = access::mode::read_write>
using trisycl::host_accessor< DataType, Dimensions, AccessMode >::base = accessor<DataType, Dimensions, AccessMode, access::target::host_buffer>  [private]
```

Definition at line 503 of file accessor.hpp.

9.9.2.3.2 Constructor & Destructor Documentation

9.9.2.3.2.1 host_accessor()

```
template<typename DataType , int Dimensions, access::mode AccessMode = access::mode::read_write>
template<typename Allocator >
trisycl::host_accessor< DataType, Dimensions, AccessMode >::host_accessor (
            buffer< DataType, Dimensions, Allocator > & target_buffer )  [inline]
```

Create an accessor to a buffer to access from the host.

Definition at line 512 of file accessor.hpp.

```
00513     : base { target_buffer } {}
```

9.9.2.3.3 Member Function Documentation

9.9.2.3.3.1 accessor() [1/4]

```
template<typename DataType , int Dimensions, access::mode AccessMode = access::mode::read_write>
template<typename Allocator >
trisycl::accessor< DataType, Dimensions, AccessMode, Target >::accessor (
            buffer< DataType, Dimensions, Allocator > & target_buffer )  [inline]
```

Construct a buffer accessor from a buffer.

Constructor only available for host_buffer target.

access_target defines the form of access being obtained.

Definition at line 125 of file accessor.hpp.

```
00126     : implementation_t {
00127     new detail::accessor<DataType, Dimensions, AccessMode, Target> {
00128       target_buffer.implementation->implementation }
00129   } {
00130     static_assert(Target == access::target::host_buffer,
00131                   "without a handler, access target should be host_buffer");
00132   }
```

9.9.2.3.3.2 accessor() [2/4]

```
template<typename DataType , int Dimensions, access::mode AccessMode = access::mode::read_write>
template<typename Allocator >
trisycl::accessor< DataType, Dimensions, AccessMode, Target >::accessor (
            buffer< DataType, Dimensions, Allocator > & target_buffer,
            handler & command_group_handler )  [inline]
```

Construct a buffer accessor from a buffer using a command group handler object from the command group scope.

Constructor only available for global_buffer or constant_buffer target.

access_target defines the form of access being obtained.

Todo Add template allocator type in all the accessor constructors in the specification or just use a more opaque Buffer type?

Todo fix specification where access mode should be target instead

Definition at line 104 of file accessor.hpp.

```
00105                                       : implementation_t {
00106     new detail::accessor<DataType, Dimensions, AccessMode, Target> {
00107       target_buffer.implementation->implementation, command_group_handler }
00108   } {
00109     static_assert(Target == access::target::global_buffer
00110                   || Target == access::target::constant_buffer,
00111                   "access target should be global_buffer or constant_buffer "
00112                   "when a handler is used");
00113     // Now the implementation is created, register it
00114     implementation->register_accessor();
00115   }
```

9.9.2.3.3.3 accessor() [3/4]

```
template<typename DataType , int Dimensions, access::mode AccessMode = access::mode::read_write>
template<typename Allocator >
trisycl::accessor< DataType, Dimensions, AccessMode, Target >::accessor (
            buffer< DataType, Dimensions, Allocator > & target_buffer,
            handler & command_group_handler,
            const range< Dimensions > & offset,
            const range< Dimensions > & range )  [inline]
```

Construct a buffer accessor from a buffer given a specific range for access permissions and an offset that provides the starting point for the access range using a command group handler object from the command group scope.

This accessor limits the processing of the buffer to the [offset, offset+range[for every dimension. Any other parts of the buffer will be unaffected.

Constructor only available for access modes global_buffer, and constant_buffer (see Table "Buffer accessor constructors"). access_target defines the form of access being obtained.

This accessor is recommended for discard-write and discard read write access modes, when the unaffected parts of the processing should be retained.

Definition at line 153 of file accessor.hpp.

```
00156                                       {
00157     TRISYCL_UNIMPL;
00158   }
```

9.9.2.3.3.4 accessor() [4/4]

```
template<typename DataType , int Dimensions, access::mode Access↩
Mode = access::mode::read_write>
trisycl::accessor< DataType, Dimensions, AccessMode, Target >::accessor (
            const range< Dimensions > & allocation_size,
            handler & command_group_handler )  [inline]
```

Construct an accessor of dimension Dimensions with elements of type DataType using the passed range to specify the size in each dimension.

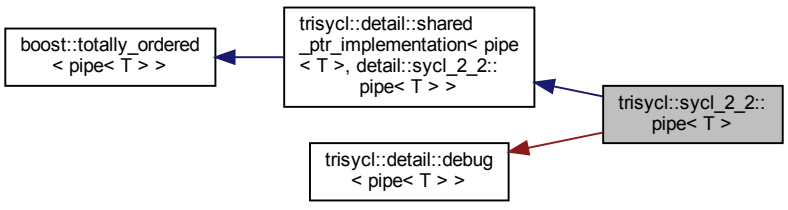
It needs as a parameter a command group handler object from the command group scope. Constructor only available if AccessMode is local, see Table 3.25.

Definition at line 169 of file accessor.hpp.

```
00171     :  implementation_t { new detail::accessor<DataType,
00172                                                Dimensions,
00173                                                AccessMode,
00174                                                access::target::local> {
00175       allocation_size, command_group_handler
00176         }
00177   }
00178   {
00179     static_assert(Target == access::target::local,
00180                   "This accessor constructor requires "
00181                   "access target be local");
00182   }
```

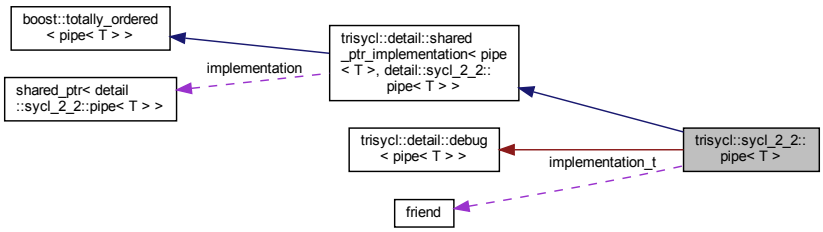
9.9.2.4 class trisycl::sycl_2_2::pipe

template<typename T>
class trisycl::sycl_2_2::pipe< T >



A SYCL pipe.

This is a proposal for the now abandoned SYCL 2.2 provisional specification. This is still here for historical reasons.



Implement a FIFO-style object that can be used through accessors to send some objects T from the input to the output

Definition at line 38 of file pipe.hpp.

```

Number of elements in the reservation.

Definition at line 46 of file pipe.hpp.

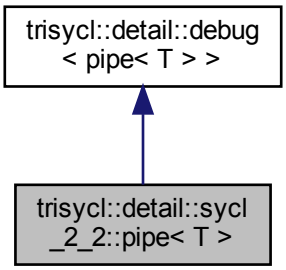
9.9.2.5.2.3 start `template<typename T >`

`boost::circular_buffer<T>::iterator trisycl::detail::sycl_2_2::reserve_id< T >::start`

Start of the reservation in the pipe storage.

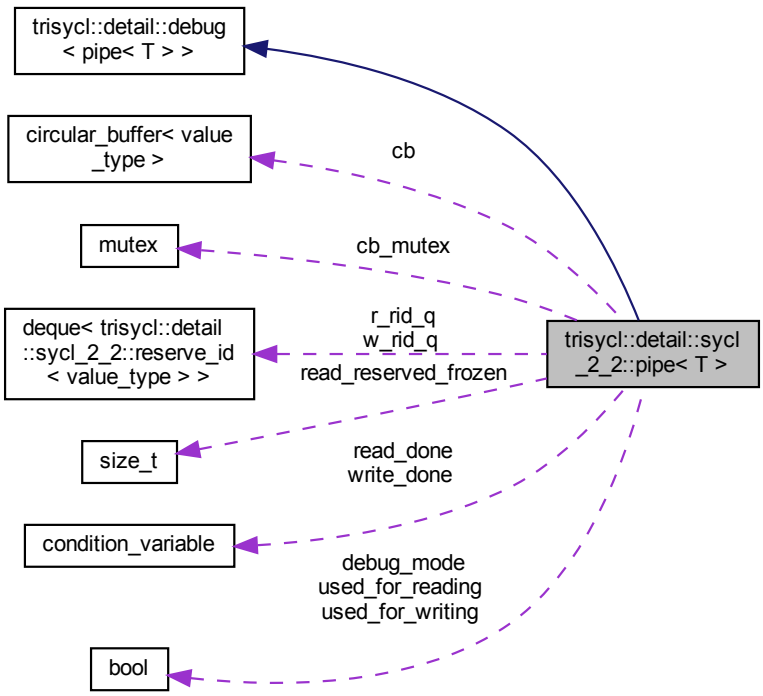
Definition at line 43 of file pipe.hpp.

9.9.2.6 class trisycl::detail::sycl_2_2::pipe



template<typename T>
class trisycl::detail::sycl_2_2::pipe< T >

Implement a pipe object.



Use some mutable members so that the pipe object can be changed even when the accessors are captured in a lambda.

Definition at line 71 of file pipe.hpp.

Inheritance diagram for trisycl::detail::sycl_2_2::pipe< T >:

Collaboration diagram for trisycl::detail::sycl_2_2::pipe< T >:

Public Types

- using value_type = T
- using implementation_t = boost::circular_buffer< value_type >

  Implement the pipe with a circular buffer.
- using rid_iterator = typename decltype(w_rid_q)::iterator

Public Member Functions

- pipe (std::size_t capacity)

  Create a pipe as a circular buffer of the required capacity.
- std::size_t capacity () const

  Return the maximum number of elements that can fit in the pipe.
- std::size_t size_with_lock () const

  The size() method used outside needs to lock the datastructure.
- bool empty_with_lock () const

  The empty() method used outside needs to lock the datastructure.
- bool full_with_lock () const
- bool write (const T &value, bool blocking=false)

  Try to write a value to the pipe.
- bool read (T &value, bool blocking=false)

  Try to read a value from the pipe.
- std::size_t reserved_for_reading () const

Compute the amount of elements blocked by read reservations, not yet committed.

- std::size_t reserved_for_writing () const

  Compute the amount of elements blocked by write reservations, not yet committed.
- bool reserve_read (std::size_t s, rid_iterator &rid, bool blocking=false)

  Reserve some part of the pipe for reading.
- bool reserve_write (std::size_t s, rid_iterator &rid, bool blocking=false)

  Reserve some part of the pipe for writing.
- void move_read_reservation_forward ()

  Process the read reservations that are ready to be released in the reservation queue.
- void move_write_reservation_forward ()

  Process the write reservations that are ready to be released in the reservation queue.

Public Attributes

- bool used_for_reading = false

  True when the pipe is currently used for reading.
- bool used_for_writing = false

  True when the pipe is currently used for writing.

Private Member Functions

- std::size_t size () const

  Get the current number of elements in the pipe that can be read.
- bool empty () const

  Test if the pipe is empty.
- bool full () const

  Test if the pipe is full.

Private Attributes

- boost::circular_buffer< value_type > cb

  The circular buffer to store the elements.
- std::mutex cb_mutex

  To protect the access to the circular buffer.
- std::deque< reserve_id< value_type > > w_rid_q

  The queue of pending write reservations.
- std::deque< reserve_id< value_type > > r_rid_q

  The queue of pending read reservations.
- std::size_t read_reserved_frozen

  Track the number of frozen elements related to read reservations.
- std::condition_variable read_done

  To signal that a read has been successful.
- std::condition_variable write_done

  To signal that a write has been successful.
- bool debug_mode = false

  To control the debug mode, disabled by default.

9.9.2.6.4.6 read_reserved_frozen template<typename T >

std::size_t trisycl::detail::sycl_2_2::pipe< T >::read_reserved_frozen [private]

Track the number of frozen elements related to read reservations.

Definition at line 107 of file pipe.hpp.

Referenced by trisycl::detail::sycl_2_2::pipe< T >::move_read_reservation_forward(), trisycl::detail::sycl_2_2::pipe< T >::read(), trisycl::detail::sycl_2_2::pipe< T >::reserve_read(), and trisycl::detail::sycl_2_2::pipe< T >::reserved_for_reading().

9.9.2.6.4.7 used_for_reading template<typename T >

bool trisycl::detail::sycl_2_2::pipe< T >::used_for_reading = false

True when the pipe is currently used for reading.

Definition at line 121 of file pipe.hpp.

9.9.2.6.4.8 used_for_writing template<typename T >

bool trisycl::detail::sycl_2_2::pipe< T >::used_for_writing = false

True when the pipe is currently used for writing.

Definition at line 124 of file pipe.hpp.

9.9.2.6.4.9 w_rid_q template<typename T >

std::deque<reserve_id<value_type> > trisycl::detail::sycl_2_2::pipe< T >::w_rid_q [private]

The queue of pending write reservations.

Definition at line 92 of file pipe.hpp.

Referenced by trisycl::detail::sycl_2_2::pipe< T >::move_write_reservation_forward(), trisycl::detail::sycl_2_2::pipe< T >::reserve_w and trisycl::detail::sycl_2_2::pipe< T >::reserved_for_writing().

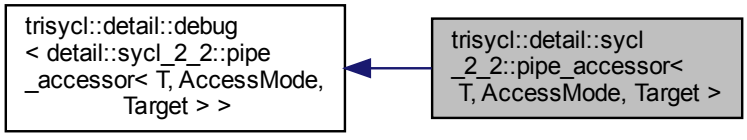
9.9.2.6.4.10 write_done template<typename T >

std::condition_variable trisycl::detail::sycl_2_2::pipe< T >::write_done [private]

To signal that a write has been successful.

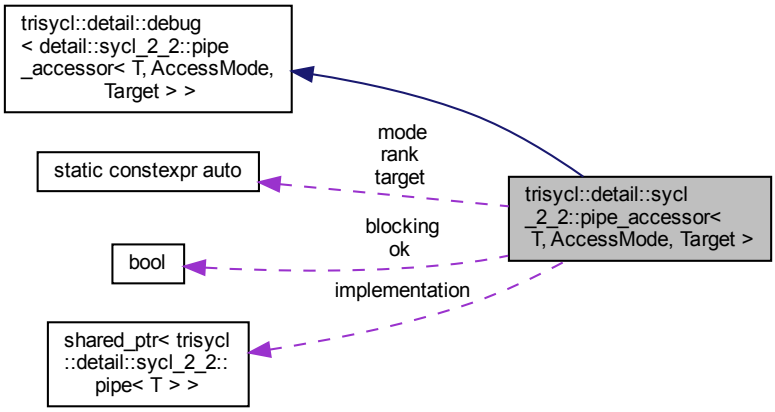
Definition at line 113 of file pipe.hpp.

Referenced by trisycl::detail::sycl_2_2::pipe< T >::move_write_reservation_forward(), trisycl::detail::sycl_2_2::pipe< T >::read(), trisycl::detail::sycl_2_2::pipe< T >::reserve_read(), and trisycl::detail::sycl_2_2::pipe< T >::write().



9.9.2.7 class trisycl::detail::sycl_2_2::pipe_accessor

template<typename T, access::mode AccessMode, access::target Target>
class trisycl::detail::sycl_2_2::pipe_accessor< T, AccessMode, Target >



The accessor abstracts the way pipe data are accessed inside a kernel.

Definition at line 49 of file pipe_accessor.hpp.

Collaboration diagram for trisycl::detail::sycl_2_2::pipe_accessor< T, AccessMode, Target >:

Public Types

- using value_type = T

  The STL-like types.
- using reference = value_type &
- using const_reference = const value_type &

Public Member Functions

- pipe_accessor (const std::shared_ptr< detail::sycl_2_2::pipe< T > > &p)

  Construct a pipe accessor from an existing pipe.
- pipe_accessor (const std::shared_ptr< detail::sycl_2_2::pipe< T > > &p, handler &command_group_↩ handler)

  Construct a pipe accessor from an existing pipe.
- pipe_accessor ()=default
- std::size_t capacity () const

  Return the maximum number of elements that can fit in the pipe.
- std::size_t size () const

  Get the current number of elements in the pipe.
- bool empty () const

  Test if the pipe is empty.
- bool full () const

  Test if the pipe is full.
- operator bool () const

  In an explicit bool context, the accessor gives the success status of the last access.
- const pipe_accessor & write (const value_type &value) const

  Try to write a value to the pipe.
- const pipe_accessor & operator<< (const value_type &value) const

  Some syntactic sugar to use.
- const pipe_accessor & read (value_type &value) const

  Try to read a value from the pipe.

- value_type read () const

  Read a value from a blocking pipe.
- const pipe_accessor & operator>> (value_type &value) const

  Some syntactic sugar to use.
- detail::sycl_2_2::pipe_reservation< pipe_accessor > reserve (std::size_t size) const
- void set_debug (bool enable) const

  Set debug mode.
- auto & get_pipe_detail ()
- ~pipe_accessor ()

Static Public Attributes

- static constexpr auto rank = 1
- static constexpr auto mode = AccessMode
- static constexpr auto target = Target
- static constexpr bool blocking

Private Attributes

- std::shared_ptr< detail::sycl_2_2::pipe< T > > implementation

  The real pipe implementation behind the hood.
- bool ok = false

  Store the success status of last pipe operation.

9.9.2.7.3 Member Function Documentation

9.9.2.7.3.1 capacity() template<typename T , access::mode AccessMode, access::target Target>
std::size_t trisycl::detail::sycl_2_2::pipe_accessor< T, AccessMode, Target >::capacity ( ) const [inline]

Return the maximum number of elements that can fit in the pipe.

Definition at line 120 of file pipe_accessor.hpp.
```
00120                             {
00121     return implementation->capacity();
00122   }
```

References trisycl::detail::sycl_2_2::pipe_accessor< T, AccessMode, Target >::implementation.

9.9.2.7.3.2 empty() template<typename T , access::mode AccessMode, access::target Target>
bool trisycl::detail::sycl_2_2::pipe_accessor< T, AccessMode, Target >::empty ( ) const [inline]

Test if the pipe is empty.

This is obviously a volatile value which is constrained by restricted relativity.

Note that on some devices it may be costly to implement on the write side (for example on FPGA).

Definition at line 145 of file pipe_accessor.hpp.
```
00145                   {
00146     return implementation->empty_with_lock();
00147   }
```

References trisycl::detail::sycl_2_2::pipe_accessor< T, AccessMode, Target >::implementation.

9.9.2.7.3.3 full() template<typename T , access::mode AccessMode, access::target Target> bool trisycl::detail::sycl_2_2::pipe_accessor< T, AccessMode, Target >::full ( ) const [inline]

Test if the pipe is full.

This is obviously a volatile value which is constrained by restricted relativity.

Note that on some devices it may be costly to implement on the read side (for example on FPGA).

Definition at line 158 of file pipe_accessor.hpp.

```
00158                     {
00159     return implementation->full_with_lock();
00160   }
```

References trisycl::detail::sycl_2_2::pipe_accessor< T, AccessMode, Target >::implementation.

9.9.2.7.3.4 get_pipe_detail() template<typename T , access::mode AccessMode, access::target Target> auto & trisycl::detail::sycl_2_2::pipe_accessor< T, AccessMode, Target >::get_pipe_detail ( ) [inline]

Definition at line 281 of file pipe_accessor.hpp.

```
00281                               {
00282     return implementation;
00283   }
```

References trisycl::detail::sycl_2_2::pipe_accessor< T, AccessMode, Target >::implementation.

9.9.2.7.3.5 operator bool() template<typename T , access::mode AccessMode, access::target Target> trisycl::detail::sycl_2_2::pipe_accessor< T, AccessMode, Target >::operator bool ( ) const [inline], [explicit]

In an explicit bool context, the accessor gives the success status of the last access.

It is not impacted by reservation success.

The explicitness is related to avoid

```
 some_pipe «
some_value
```

to be interpreted as

```
 some_bool «
some_value
```

when the type of

```
some_value
```

is not the same type as the pipe type.

Returns

true on success of the previous read or write operation

Definition at line 175 of file pipe_accessor.hpp.

```
00175                                {
00176     return ok;
00177   }
```

References trisycl::detail::sycl_2_2::pipe_accessor< T, AccessMode, Target >::ok.

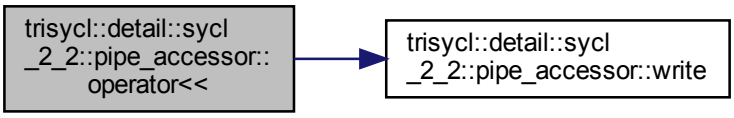
9.9.2.7.3.6 operator<<()

```
template<typename T , access::mode AccessMode, access::target Target>
const pipe_accessor & trisycl::detail::sycl_2_2::pipe_accessor< T, AccessMode, Target >↩
::operator<< (
              const value_type & value ) const  [inline]
```

Some syntactic sugar to use.

```
a « v
```

instead of



```
a.write(v)
```

Definition at line 205 of file pipe_accessor.hpp.

```
00205                                                                    {
00206     static_assert(mode == access::mode::write,
00207                   "'«' operator on a pipe accessor is only possible"
00208                   " with write access mode");
00209     // Return a reference to *this so we can apply a sequence of «
00210     return write(value);
00211   }
```

References trisycl::detail::sycl_2_2::pipe_accessor< T, AccessMode, Target >::mode, trisycl::access::write, and trisycl::detail::sycl_2_2::pipe_accessor< T, AccessMode, Target >::write().

Here is the call graph for this function:

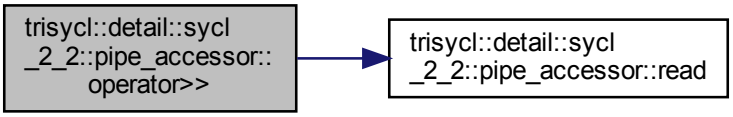
9.9.2.7.3.7 operator>>()

```
template<typename T , access::mode AccessMode, access::target Target>
const pipe_accessor & trisycl::detail::sycl_2_2::pipe_accessor< T, AccessMode, Target >↩
::operator>> (
              value_type & value ) const  [inline]
```

Some syntactic sugar to use.

```
a » v
```

instead of



```
a.read(v)
```

Definition at line 260 of file pipe_accessor.hpp.

```
00260                                                                    {
00261     static_assert(mode == access::mode::read,
00262                   "'»' operator on a pipe accessor is only possible"
00263                   " with read access mode");

00265     return read(value);
00266   }
```

References trisycl::detail::sycl_2_2::pipe_accessor< T, AccessMode, Target >::mode, trisycl::access::read, and trisycl::detail::sycl_2_2::pipe_accessor< T, AccessMode, Target >::read().

Here is the call graph for this function:

9.9.2.7.3.8 read() [1/2]

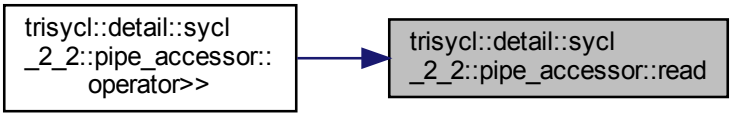
```
template<typename T , access::mode AccessMode, access::target Target>
value_type trisycl::detail::sycl_2_2::pipe_accessor< T, AccessMode, Target >::read ( ) const
[inline]
```

Read a value from a blocking pipe.

Returns

the read value directly, since it cannot fail on blocking pipe

This function is const so it can work when the accessor is passed by copy in the [=] kernel lambda, which is not mutable by default



Definition at line 245 of file pipe_accessor.hpp.

```
00245                                {
00246     static_assert(mode == access::mode::read,
00247                   "'.read()' method on a pipe accessor is only possible"
00248                   " with read access mode");
00249     static_assert(blocking,
00250                   "'.read()' method on a pipe accessor is only possible"
00251                   " with a blocking pipe");
00252     value_type value;
00253     implementation->read(value, blocking);
00254     return value;
00255   }
```

References trisycl::detail::sycl_2_2::pipe_accessor< T, AccessMode, Target >::blocking, trisycl::detail::sycl_2_2::pipe_accessor< T, trisycl::detail::sycl_2_2::pipe_accessor< T, AccessMode, Target >::mode, and trisycl::access::read.

Here is the caller graph for this function:

9.9.2.7.3.9 read() [2/2]

```
template<typename T , access::mode AccessMode, access::target Target>
const pipe_accessor & trisycl::detail::sycl_2_2::pipe_accessor< T, AccessMode, Target >::read
(
            value_type & value ) const  [inline]
```

Try to read a value from the pipe.

Parameters

out	*value*	is the reference to where to store what is read

Returns

`this`

so we can apply a sequence of read for example (but do not do this on a non blocking pipe...)

This function is const so it can work when the accessor is passed by copy in the [=] kernel lambda, which is not mutable by default

Definition at line 226 of file pipe_accessor.hpp.

```
00226                                                {
00227     static_assert(mode == access::mode::read,
00228                   "'.read(value_type &value)' method on a pipe accessor"
00229                   " is only possible with read access mode");
00230     ok = implementation->read(value, blocking);

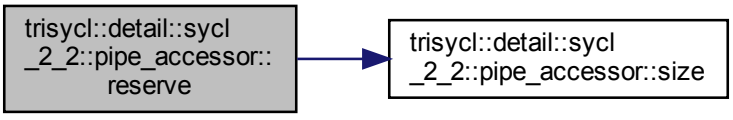
00232     return *this;
00233   }
```

References trisycl::detail::sycl_2_2::pipe_accessor< T, AccessMode, Target >::blocking, trisycl::detail::sycl_2_2::pipe_accessor< T, trisycl::detail::sycl_2_2::pipe_accessor< T, AccessMode, Target >::mode, trisycl::detail::sycl_2_2::pipe_accessor< T, AccessMode, and trisycl::access::read.

9.9.2.7.3.10 reserve()



```
template<typename T , access::mode AccessMode, access::target Target>
detail::sycl_2_2::pipe_reservation< pipe_accessor > trisycl::detail::sycl_2_2::pipe_accessor<
T, AccessMode, Target >::reserve (
            std::size_t size ) const  [inline]
```

Definition at line 270 of file pipe_accessor.hpp.

```
00270                                        {
00271     return { *implementation, size };
00272   }
```

References trisycl::detail::sycl_2_2::pipe_accessor< T, AccessMode, Target >::implementation, and trisycl::detail::sycl_2_2::pipe_ac

Here is the call graph for this function:

9.9.2.7.3.11 set_debug()

```
template<typename T , access::mode AccessMode, access::target Target>
void trisycl::detail::sycl_2_2::pipe_accessor< T, AccessMode, Target >::set_debug (
            bool enable ) const  [inline]
```

Set debug mode.

Definition at line 276 of file pipe_accessor.hpp.

```
00276                                    {
00277     implementation->debug_mode = enable;
00278   }
```

References trisycl::detail::sycl_2_2::pipe_accessor< T, AccessMode, Target >::implementation.

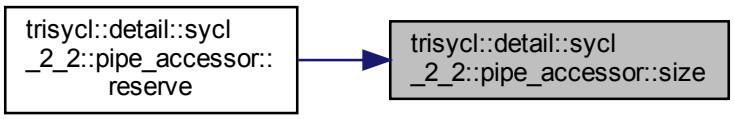
9.9.2.7.3.12 size()

```
template<typename T , access::mode AccessMode, access::target Target>
std::size_t trisycl::detail::sycl_2_2::pipe_accessor< T, AccessMode, Target >::size ( ) const
[inline]
```

Get the current number of elements in the pipe.

This is obviously a volatile value which is constrained by restricted relativity.

Note that on some devices it may be costly to implement (for example on FPGA).



Definition at line 132 of file pipe_accessor.hpp.

```
00132                          {
00133     return implementation->size_with_lock();
00134   }
```

References trisycl::detail::sycl_2_2::pipe_accessor< T, AccessMode, Target >::implementation.

Referenced by trisycl::detail::sycl_2_2::pipe_accessor< T, AccessMode, Target >::reserve().

Here is the caller graph for this function:

9.9.2.7.3.13 write()

```
template<typename T , access::mode AccessMode, access::target Target>
const pipe_accessor & trisycl::detail::sycl_2_2::pipe_accessor< T, AccessMode, Target >::write
(
            const value_type & value ) const  [inline]
```

Try to write a value to the pipe.

Parameters

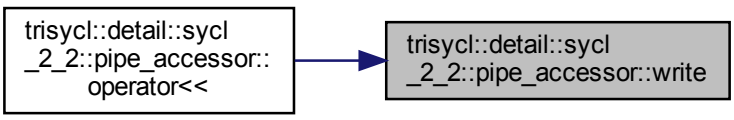
in	*value*	is what we want to write

Returns

this so we can apply a sequence of write for example (but do not do this on a non blocking pipe...)

Todo provide a && version

This function is const so it can work when the accessor is passed by copy in the [=] kernel lambda, which is not mutable by default



Definition at line 193 of file pipe_accessor.hpp.

```
00193                                                                {
00194     static_assert(mode == access::mode::write,

trisycl::detail::sycl_2_2::pipe_accessor< T, AccessMode, Target >::write(), and trisycl::detail::sycl_2_2::pipe_accessor< T, AccessM

9.9.2.7.4.4 ok

`template<typename T , access::mode AccessMode, access::target Target> bool trisycl::detail::sycl_2_2::pipe_accessor< T, AccessMode, Target >::ok = false [mutable], [private]`

Store the success status of last pipe operation.

It is not impacted by reservation success.

It does exist even if the pipe accessor is not evaluated in a boolean context for, but a use-def analysis can optimise it out in that case and not use some storage

Use a mutable state here so that it can work with a [=] lambda capture without having to declare the whole lambda as mutable

Definition at line 82 of file pipe_accessor.hpp.

Referenced by trisycl::detail::sycl_2_2::pipe_accessor< T, AccessMode, Target >::operator bool(), trisycl::detail::sycl_2_2::pipe_acce

9.9.2.8.2 Constructor & Destructor Documentation

9.9.2.8.2.1 pipe_reservation() [1/3] template<typename PipeAccessor >

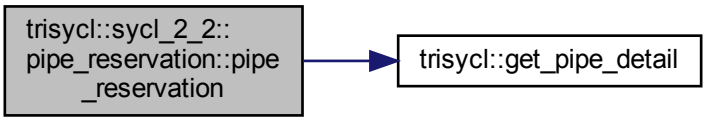
```
trisycl::sycl_2_2::pipe_reservation< PipeAccessor >::pipe_reservation ( ) [default]
```

Use default constructors so that we can create a new buffer copy from another one, with either a l-value or a r-value (for std::move() for example).

Since we just copy the shared_ptr<> above, this is where/how the sharing magic is happening with reference counting in this case.

9.9.2.8.2.2 pipe_reservation() [2/3] template<typename PipeAccessor >

```
trisycl::sycl_2_2::pipe_reservation< PipeAccessor >::pipe_reservation (
            accessor_type & accessor,
            std::size_t s )  [inline]
```



Create a pipe_reservation for an accessor and a number of elements.

Definition at line 68 of file pipe_reservation.hpp.

```
00069     : implementation {
00070     new detail::sycl_2_2::pipe_reservation<accessor_detail> {
00071       get_pipe_detail(accessor), s }
00072   } {}
```

References trisycl::get_pipe_detail().

Here is the call graph for this function:

9.9.2.8.2.3 pipe_reservation() [3/3] template<typename PipeAccessor >

```
trisycl::sycl_2_2::pipe_reservation< PipeAccessor >::pipe_reservation (
            detail::sycl_2_2::pipe_reservation< accessor_detail > && pr )  [inline]
```

Create a pipe_reservation from the implementation detail.

This is an internal constructor to allow reserve() on the implementation to lift a full-fledged object through accessor::reserve().

Todo Make it private and add required friends

Definition at line 83 of file pipe_reservation.hpp.

```
00084     : implementation {
00085     new detail::sycl_2_2::pipe_reservation<accessor_detail> { std::move(pr) } }
00086   {}
```

9.9.2.8.3 Member Function Documentation

9.9.2.8.3.1 begin() template<typename PipeAccessor >

```
iterator trisycl::sycl_2_2::pipe_reservation< PipeAccessor >::begin ( ) const  [inline]
```

Get an iterator on the first element of the reservation station.

Definition at line 121 of file pipe_reservation.hpp.

```
00121                          {
00122     return implementation->begin();
00123   }
```

9.9.2.8.3.2 cbegin() template<typename PipeAccessor >

const_iterator trisycl::sycl_2_2::pipe_reservation< PipeAccessor >::cbegin ( ) const [inline]

Build a constant iterator on the first element of the reservation station.

Definition at line 133 of file pipe_reservation.hpp.

```
00133                                  {
00134     return implementation->begin();
00135   }
```

9.9.2.8.3.3 cend() template<typename PipeAccessor >

const_iterator trisycl::sycl_2_2::pipe_reservation< PipeAccessor >::cend ( ) const [inline]

Build a constant iterator past the end of the reservation station.

Definition at line 139 of file pipe_reservation.hpp.

```
00139                                {
00140     return implementation->end();
00141   }
```

9.9.2.8.3.4 commit() template<typename PipeAccessor >

void trisycl::sycl_2_2::pipe_reservation< PipeAccessor >::commit ( ) const [inline]

Force a commit operation.

Normally the commit is implicitly done in the destructor, but sometime it is useful to do it earlier.

Definition at line 115 of file pipe_reservation.hpp.

```
00115                          {
00116     return implementation->commit();
00117   }
```

9.9.2.8.3.5 crbegin() template<typename PipeAccessor >

const_reverse_iterator trisycl::sycl_2_2::pipe_reservation< PipeAccessor >::crbegin ( ) const [inline]

Get a constant reverse iterator on the last element of the reservation station.

Definition at line 159 of file pipe_reservation.hpp.

```
00159                                          {
00160     return std::make_reverse_iterator(cend());
00161   }
```

9.9.2.8.3.6 crend() template<typename PipeAccessor >

const_reverse_iterator trisycl::sycl_2_2::pipe_reservation< PipeAccessor >::crend ( ) const [inline]

Get a constant reverse iterator on the first element past the end of the reservation station.

Definition at line 166 of file pipe_reservation.hpp.

```
00166                                        {
00167     return std::make_reverse_iterator(cbegin());
00168   }
```

9.9.2.8.3.7 end() template<typename PipeAccessor >

iterator trisycl::sycl_2_2::pipe_reservation< PipeAccessor >::end ( ) const [inline]

Get an iterator past the end of the reservation station.

Definition at line 127 of file pipe_reservation.hpp.

```
00127                         {
00128     return implementation->end();
00129   }
```

9.9.2.8.3.8 operator bool() template<typename PipeAccessor >

trisycl::sycl_2_2::pipe_reservation< PipeAccessor >::operator bool ( ) const [inline]

Test if the pipe_reservation has been correctly allocated.

Returns

true if the pipe_reservation can be used and committed

Definition at line 93 of file pipe_reservation.hpp.

```
00093                         {
00094     return *implementation;
00095   }
```

9.9.2.8.3.9 operator[]() template<typename PipeAccessor >

reference trisycl::sycl_2_2::pipe_reservation< PipeAccessor >::operator[] (
std::size_t *index*) const [inline]

Access to a given element of the reservation.

Definition at line 105 of file pipe_reservation.hpp.

```
00105                                          {
00106     return (*implementation)[index];
00107   }
```

9.9.2.8.3.10 rbegin() template<typename PipeAccessor >

reverse_iterator trisycl::sycl_2_2::pipe_reservation< PipeAccessor >::rbegin ( ) const [inline]

Get a reverse iterator on the last element of the reservation station.

Definition at line 145 of file pipe_reservation.hpp.

```
00145                                  {
00146     return std::make_reverse_iterator(end());
00147   }
```

9.9.2.8.3.11 rend() template<typename PipeAccessor >

reverse_iterator trisycl::sycl_2_2::pipe_reservation< PipeAccessor >::rend ( ) const [inline]

Get a reverse iterator on the first element past the end of the reservation station.

Definition at line 152 of file pipe_reservation.hpp.

```
00152                                {
00153     return std::make_reverse_iterator(begin());
00154   }
```

9.9.2.8.3.12 size() template<typename PipeAccessor >

std::size_t trisycl::sycl_2_2::pipe_reservation< PipeAccessor >::size ( ) const [inline]

Get the number of reserved element(s)

Definition at line 99 of file pipe_reservation.hpp.

```
00099                          {
00100     return implementation->size();
00101   }
```

9.9.2.8.4 Member Data Documentation

9.9.2.8.4.1 blocking template<typename PipeAccessor >

constexpr bool trisycl::sycl_2_2::pipe_reservation< PipeAccessor >::blocking [static], [constexpr]

Initial value:

```
=
    (accessor_type::target == trisycl::access::target::blocking_pipe)
```

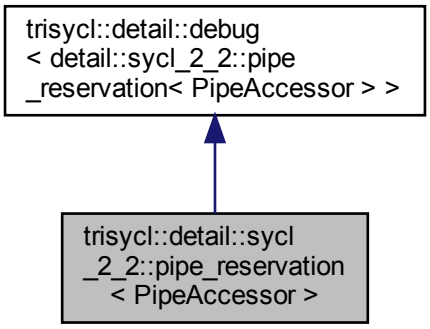
Definition at line 34 of file pipe_reservation.hpp.

9.9.2.8.4.2 implementation template<typename PipeAccessor >

std::shared_ptr<detail::sycl_2_2::pipe_reservation<accessor_detail> > trisycl::sycl_2_2::pipe_reservation< PipeAccessor >::implementation

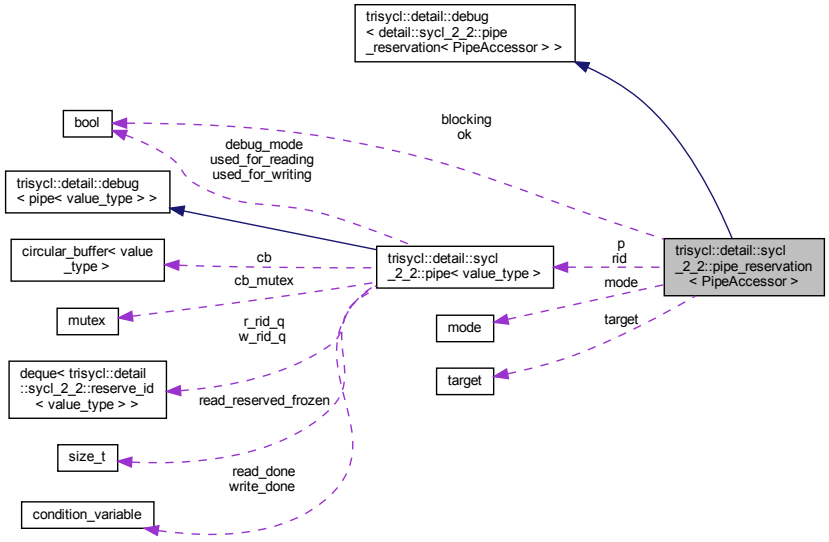
Point to the underlying implementation that can be shared in the SYCL model with a handler semantics.

Definition at line 55 of file pipe_reservation.hpp.



9.9.2.9 class trisycl::detail::sycl_2_2::pipe_reservation

template<typename PipeAccessor>
class trisycl::detail::sycl_2_2::pipe_reservation< PipeAccessor >



The implementation of the pipe reservation station.

Definition at line 36 of file pipe_reservation.hpp.

Inheritance diagram for trisycl::detail::sycl_2_2::pipe_reservation< PipeAccessor >:

Collaboration diagram for trisycl::detail::sycl_2_2::pipe_reservation< PipeAccessor >:

Public Types

- using iterator = typename detail::sycl_2_2::pipe< value_type >::implementation_t::iterator
- using const_iterator = typename detail::sycl_2_2::pipe< value_type >::implementation_t::const_iterator

Public Member Functions

- void assume_validity ()

  Test that the reservation is in a usable state.
- pipe_reservation (detail::sycl_2_2::pipe< value_type > &p, std::size_t s)

  Create a pipe reservation station that reserves the pipe itself.
- pipe_reservation (const pipe_reservation &)=delete

  No copy constructor with some spurious commit in the destructor of the original object.
- pipe_reservation (pipe_reservation &&orig)

  Only a move constructor is required to move it into the shared_ptr.
- pipe_reservation ()=default

  Keep the default constructors too.
- operator bool ()

  Test if the reservation succeeded and thus if the reservation can be committed.
- iterator begin ()

  Start of the reservation area.
- iterator end ()

  Past the end of the reservation area.
- std::size_t size ()

  Get the number of elements in the reservation station.
- reference operator[ ] (std::size_t index)

  Access to an element of the reservation.
- void commit ()

  Commit the reservation station.
- ~pipe_reservation ()

  An implicit commit is made in the destructor.

Public Attributes

- bool ok = false

  True if the reservation was successful and still uncommitted.
- detail::sycl_2_2::pipe< value_type >::rid_iterator rid

  Point into the reservation buffer. Only valid if ok is true.
- detail::sycl_2_2::pipe< value_type > & p

  Keep a reference on the pipe to access to the data and methods.

Static Public Attributes

- static constexpr access::mode mode = accessor_type::mode
- static constexpr access::target target = accessor_type::target

Private Types

- using accessor_type = PipeAccessor
- using value_type = typename accessor_type::value_type
- using reference = typename accessor_type::reference

Static Private Attributes

- static constexpr bool blocking

`detail::sycl_2_2::pipe<value_type>::rid_iterator trisycl::detail::sycl_2_2::pipe_reservation< PipeAccessor >::rid`

Point into the reservation buffer. Only valid if ok is true.

Definition at line 61 of file pipe_reservation.hpp.

Referenced by trisycl::detail::sycl_2_2::pipe_reservation< PipeAccessor >::begin(), trisycl::detail::sycl_2_2::pipe_reservation< PipeA trisycl::detail::sycl_2_2::pipe_reservation< PipeAccessor >::end(), trisycl::detail::sycl_2_2::pipe_reservation< PipeAccessor >::oper trisycl::detail::sycl_2_2::pipe_reservation< PipeAccessor >::pipe_reservation(), and trisycl::detail::sycl_2_2::pipe_reservation< Pipe

9.9.2.9.4.6 target `template<typename PipeAccessor >`

`constexpr access::target trisycl::detail::sycl_2_2::pipe_reservation< PipeAccessor >::target = accessor_type::target [static], [constexpr]`

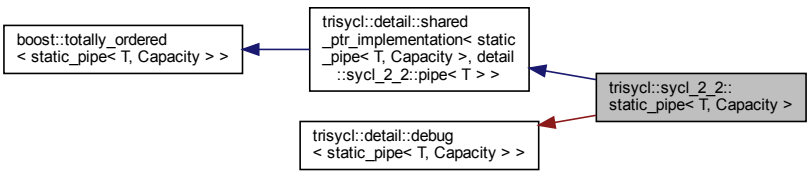
Definition at line 53 of file pipe_reservation.hpp.

9.9.2.10 class trisycl::sycl_2_2::static_pipe

template< typename T, std::size_t Capacity >
class trisycl::sycl_2_2::static_pipe< T, Capacity >

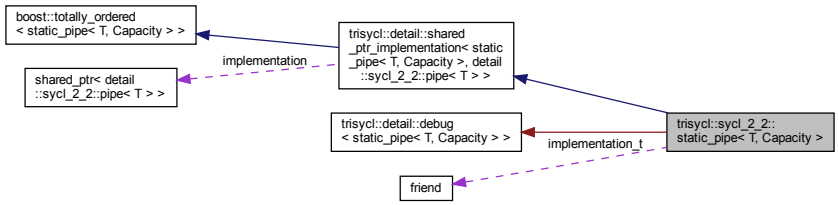
A SYCL static-scoped pipe equivalent to an OpenCL program-scoped pipe.

Implement a FIFO-style object that can be used through accessors to send some objects T from the input to the output.



Compared to a normal pipe, a static_pipe takes a constexpr size and is expected to be declared in a compile-unit static context so the compiler can generate everything at compile time.

This is useful to generate a fixed and optimized hardware implementation on FPGA for example, where the inter-connection graph can be also inferred at compile time.



It is not directly mapped to the OpenCL program-scoped pipe because in SYCL there is not this concept of separated program. But the SYCL device compiler is expected to generate some OpenCL program(s) with program-scoped pipes when a SYCL static-scoped pipe is used. These details are implementation defined.

Definition at line 52 of file static_pipe.hpp.

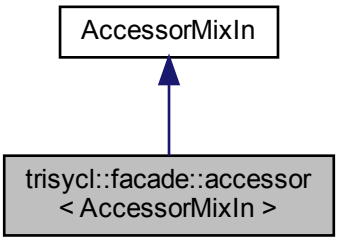
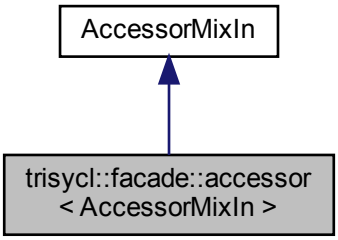
9.10.1 Detailed Description

9.10.2 Class Documentation



9.10.2.1 class trisycl::facade::accessor

template<typename AccessorMixIn>
class trisycl::facade::accessor< AccessorMixIn >



SYCL accessor facade providing multi-dimensional access features.

Definition at line 28 of file accessor.hpp.

Inheritance diagram for trisycl::facade::accessor< AccessorMixIn >:

Collaboration diagram for trisycl::facade::accessor< AccessorMixIn >:

Public Types

- using iterator = typename mixin::pointer
- using const_iterator = typename mixin::const_pointer
- using reverse_iterator = typename std::reverse_iterator< iterator >
- using const_reverse_iterator = typename std::reverse_iterator< const_iterator >

Public Member Functions

- template<std::integral... T>
  decltype(auto) operator[ ] (T... indices)

  Use the accessor with integers à la [i1][i2][i3] or C++23 [i1, i2,...].
- template<std::integral... T>
  decltype(auto) operator[ ] (T... indices) const

  Use the accessor with integers à la [i1][i2][i3] or C++23 [i1, i2,...].
- decltype(auto) operator[ ] (const id< mixin::rank()> &index)

  To use the accessor with [id<>].
- decltype(auto) operator[ ] (const id< mixin::rank()> &index) const

  To use the accessor with [id<>].
- decltype(auto) operator[ ] (const item< mixin::rank()> &index)

  To use an accessor with [item<>].
- decltype(auto) operator[ ] (const item< mixin::rank()> &index) const

  To use an accessor with [item<>].
- decltype(auto) operator[ ] (const nd_item< mixin::rank()> &index)

  To use an accessor with an [nd_item<>].
- decltype(auto) operator[ ] (const nd_item< mixin::rank()> &index) const

  To use an accessor with an [nd_item<>].
- mixin::reference operator* ()

  Get the first element of the accessor.
- mixin::reference operator* () const

  Get the first element of the accessor.
- auto get_pointer ()

  Return the pointer to the data.
- iterator begin ()

Forward all the iterator functions to the implementation.

- iterator end ()
- const_iterator cbegin ()
- const_iterator cend ()
- reverse_iterator rbegin ()
- reverse_iterator rend ()
- const_reverse_iterator crbegin () const
- const_reverse_iterator crend () const

Private Types

- using mixin = AccessorMixIn

9.10.2.1.1 Member Typedef Documentation

9.10.2.1.1.1 const_iterator `template<typename AccessorMixIn >`

```
using trisycl::facade::accessor< AccessorMixIn >::const_iterator = typename mixin::const_↩
pointer
```

Definition at line 34 of file accessor.hpp.

9.10.2.1.1.2 const_reverse_iterator `template<typename AccessorMixIn >`

```
using trisycl::facade::accessor< AccessorMixIn >::const_reverse_iterator = typename std↩
::reverse_iterator<const_iterator>
```

Definition at line 36 of file accessor.hpp.

9.10.2.1.1.3 iterator `template<typename AccessorMixIn >`

using trisycl::facade::accessor< AccessorMixIn >::iterator = typename mixin::pointer
```

Definition at line 33 of file accessor.hpp.

9.10.2.1.1.4 mixin `template<typename AccessorMixIn >`

```
using trisycl::facade::accessor< AccessorMixIn >::mixin = AccessorMixIn  [private]
```

Definition at line 30 of file accessor.hpp.

9.10.2.1.1.5 reverse_iterator `template<typename AccessorMixIn >`

```
using trisycl::facade::accessor< AccessorMixIn >::reverse_iterator = typename std::reverse_↩
iterator<iterator>
```

Definition at line 35 of file accessor.hpp.

9.10.2.1.2 Member Function Documentation

9.10.2.1.2.1 begin() `template<typename AccessorMixIn >`

`iterator trisycl::facade::accessor< AccessorMixIn >::begin ( ) [inline]`

Forward all the iterator functions to the implementation.

Todo Add these functions to the specification

Todo The fact that the lambda capture make a const copy of the accessor is not yet elegantly managed... The issue is that begin()/end() dispatch is made according to the accessor constness and not from the array member constness...

Todo try to solve it by using some enable_if on array constness?

Todo The issue is that the end may not be known if it is implemented by a raw OpenCL cl_mem... So only provide on the device the iterators related to the start? Actually the accessor needs to know a part of the shape to have the multidimentional addressing. So this only require a size_t more...

Todo Factor out these in a template helper

Todo Do we need this in detail::accessor too or only in accessor?

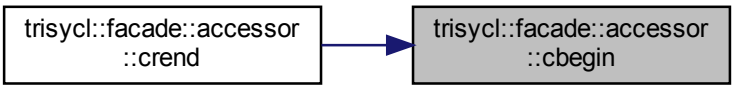
Definition at line 155 of file accessor.hpp.

```
00155 { return mixin::data(); }
```

Referenced by trisycl::facade::accessor< AccessorMixIn >::rend().

Here is the caller graph for this function:

9.10.2.1.2.2 cbegin() template<typename AccessorMixIn >



const_iterator trisycl::facade::accessor< AccessorMixIn >::cbegin ( ) [inline]

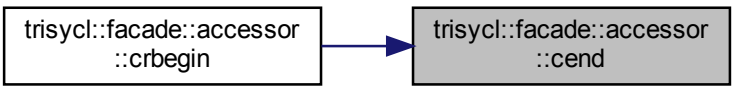
Definition at line 159 of file accessor.hpp.

```
00159 { return mixin::data(); }
```

Referenced by trisycl::facade::accessor< AccessorMixIn >::crend().

Here is the caller graph for this function:

9.10.2.1.2.3 cend() template<typename AccessorMixIn >



const_iterator trisycl::facade::accessor< AccessorMixIn >::cend ( ) [inline]

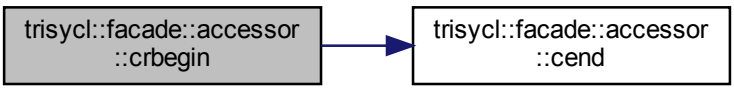
Definition at line 161 of file accessor.hpp.

```
00161 { return mixin::data() + mixin::get_count(); }
```

Referenced by trisycl::facade::accessor< AccessorMixIn >::crbegin().

Here is the caller graph for this function:

9.10.2.1.2.4 crbegin() template<typename AccessorMixIn >



const_reverse_iterator trisycl::facade::accessor< AccessorMixIn >::crbegin ( ) const [inline]

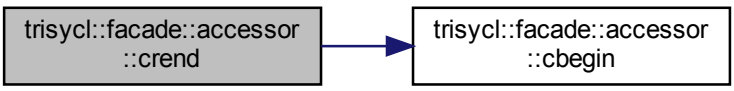
Definition at line 170 of file accessor.hpp.

```
00170                                          {
00171     return std::reverse_iterator(cend());
00172   }
```

References trisycl::facade::accessor< AccessorMixIn >::cend().

Here is the call graph for this function:

9.10.2.1.2.5 crend() template<typename AccessorMixIn >



const_reverse_iterator trisycl::facade::accessor< AccessorMixIn >::crend ( ) const [inline]

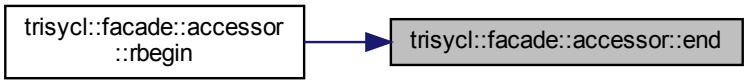
Definition at line 174 of file accessor.hpp.

```
00174                                        {
00175     return std::reverse_iterator(cbegin());
00176   }
```

References trisycl::facade::accessor< AccessorMixIn >::cbegin().

Here is the call graph for this function:

9.10.2.1.2.6 end() template<typename AccessorMixIn >



```
iterator trisycl::facade::accessor< AccessorMixIn >::end ( )  [inline]
```

Definition at line 157 of file accessor.hpp.

```
00157 { return mixin::data() + mixin::get_count(); }
```

Referenced by trisycl::facade::accessor< AccessorMixIn >::rbegin().

Here is the caller graph for this function:

9.10.2.1.2.7 get_pointer() template<typename AccessorMixIn >

```
auto trisycl::facade::accessor< AccessorMixIn >::get_pointer ( )  [inline]
```

Return the pointer to the data.

Todo Implement the various pointer address spaces

Definition at line 130 of file accessor.hpp.

```
00130 { return mixin::data(); }
```

9.10.2.1.2.8 operator*() [1/2] template<typename AccessorMixIn >

```
mixin::reference trisycl::facade::accessor< AccessorMixIn >::operator* ( )  [inline]
```

Get the first element of the accessor.

Useful with an accessor on a scalar for example.

Todo Add to the specification

Definition at line 112 of file accessor.hpp.

```
00112 { return *mixin::data(); }
```

9.10.2.1.2.9 operator*() [2/2] template<typename AccessorMixIn >

```
mixin::reference trisycl::facade::accessor< AccessorMixIn >::operator* ( ) const  [inline]
```

Get the first element of the accessor.

Useful with an accessor on a scalar for example.

Todo Add to the specification?

Todo Add the concept of 0-dim buffer and accessor for scalar and use an implicit conversion to value_type reference to access the value with the accessor?

Definition at line 124 of file accessor.hpp.

```
00124 { return *mixin::data(); }
```

9.10.2.1.2.10 operator[]() [1/8] template<typename AccessorMixIn >

```
decltype(auto) trisycl::facade::accessor< AccessorMixIn >::operator[] (
            const id< mixin::rank()> & index )  [inline]
```

To use the accessor with [id<>].

Definition at line 71 of file accessor.hpp.

```
00071                                                  {
00072     return mixin::tuple_indexed_access(index);
00073   }
```

9.10.2.1.2.11 operator[]() [2/8] template<typename AccessorMixIn >

```
decltype(auto) trisycl::facade::accessor< AccessorMixIn >::operator[] (
            const id< mixin::rank()> & index ) const  [inline]
```

To use the accessor with [id<>].

Definition at line 76 of file accessor.hpp.

```
00076                                                        {
00077     return mixin::tuple_indexed_access(index);
00078   }
```

9.10.2.1.2.12 operator[]() [3/8] template<typename AccessorMixIn >

```
decltype(auto) trisycl::facade::accessor< AccessorMixIn >::operator[] (
            const item< mixin::rank()> & index )  [inline]
```

To use an accessor with [item<>].

Definition at line 81 of file accessor.hpp.

```
00081                                                    {
00082     return (*this)[index.get()];
00083   }
```

9.10.2.1.2.13 operator[]() [4/8] template<typename AccessorMixIn >

```
decltype(auto) trisycl::facade::accessor< AccessorMixIn >::operator[] (
              const item< mixin::rank()> & index ) const  [inline]
```

To use an accessor with [item<>].

Definition at line 86 of file accessor.hpp.

```
00086                                                        {
00087     return (*this)[index.get()];
00088   }
```

9.10.2.1.2.14 operator[]() [5/8] template<typename AccessorMixIn >

```
decltype(auto) trisycl::facade::accessor< AccessorMixIn >::operator[] (
              const nd_item< mixin::rank()> & index )  [inline]
```

To use an accessor with an [nd_item<>].

Todo Add to the specification because used by HPC-GPU slide 22

Definition at line 94 of file accessor.hpp.

```
00094                                                           {
00095     return (*this)[index.get_global()];
00096   }
```

9.10.2.1.2.15 operator[]() [6/8] template<typename AccessorMixIn >

```
decltype(auto) trisycl::facade::accessor< AccessorMixIn >::operator[] (
              const nd_item< mixin::rank()> & index ) const  [inline]
```

To use an accessor with an [nd_item<>].

Todo Add to the specification because used by HPC-GPU slide 22

Definition at line 102 of file accessor.hpp.

```
00102                                                           {
00103     return (*this)[index.get_global()];
00104   }
```

9.10.2.1.2.16 operator[]() [7/8] template<typename AccessorMixIn >

```
template<std::integral...  T>
decltype(auto) trisycl::facade::accessor< AccessorMixIn >::operator[] (
              T...  indices )  [inline]
```

Use the accessor with integers à la [i1][i2][i3] or C++23 [i1, i2,...].

Returns

decltype(auto) to return either a reference to the final element when the indexing has been fully resolved or a proxy object to handle the remaining []

Definition at line 43 of file accessor.hpp.

```
00043                                                           {
00044     if constexpr (sizeof...(T) == 1)
00045       /* The [][][] case uses a proxy object to track all the [index]
00046 and aggregate them to resolve the indexing */
00047       return
00048           typename mixin::template track_index<1> { mixin::access }[indices...];
00049     else
00050       // Or just the C++23 [i1, i2,...]  case
00051       return mixin::access[indices...];
00052   }
```

9.10.2.1.2.17 operator[]() [8/8] template<typename AccessorMixIn > template<std::integral... T> decltype(auto) trisycl::facade::accessor< AccessorMixIn >::operator[] (T... *indices*) const [inline]

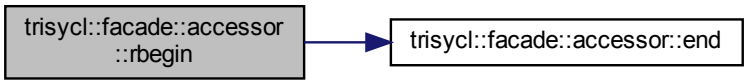
Use the accessor with integers à la [i1][i2][i3] or C++23 [i1, i2,...].

Returns

decltype(auto) to return either a reference to the final element when the indexing has been fully resolved or a proxy object to handle the remaining []

Definition at line 59 of file accessor.hpp.

```
00059                                                                                {
00060     if constexpr (sizeof...(T) == 1)
00061       /* The [][][] case uses a proxy object to track all the [index]
00062 and aggregate them to resolve the indexing */
00063       return
00064           typename mixin::template track_index<1> { mixin::access }[indices...];
00065     else
00066       // Or just the C++23 [i1, i2,...]  case
00067       return mixin::access[indices...];
00068   }
```



9.10.2.1.2.18 rbegin() template<typename AccessorMixIn > reverse_iterator trisycl::facade::accessor< AccessorMixIn >::rbegin ( ) [inline]

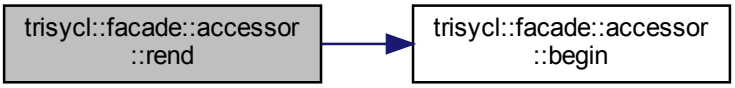
Definition at line 163 of file accessor.hpp.

```
00163 { return std::reverse_iterator(end()); }
```

References trisycl::facade::accessor< AccessorMixIn >::end().

Here is the call graph for this function:

9.10.2.1.2.19 rend() template<typename AccessorMixIn >



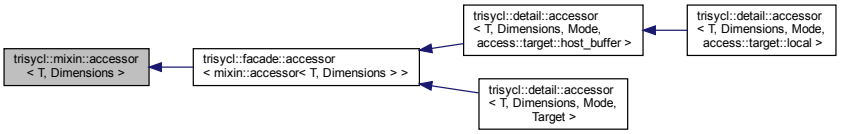
reverse_iterator trisycl::facade::accessor< AccessorMixIn >::rend ( ) [inline]

Definition at line 165 of file accessor.hpp.

```
00165                           {
00166     return std::reverse_iterator(begin());
00167     ;
00168   }
```

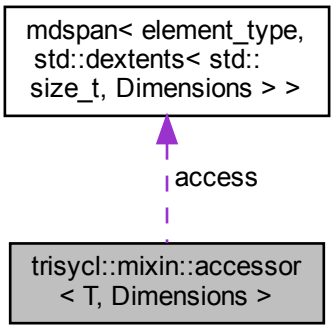
References trisycl::facade::accessor< AccessorMixIn >::begin().

Here is the call graph for this function:



9.10.2.2 class trisycl::mixin::accessor

template<typename T, int Dimensions>
class trisycl::mixin::accessor< T, Dimensions >



SYCL accessor mixin providing multi-dimensional access features.

Definition at line 26 of file accessor.hpp.

Inheritance diagram for trisycl::mixin::accessor< T, Dimensions >:

Collaboration diagram for trisycl::mixin::accessor< T, Dimensions >:

Public Types

- using element_type = T

  Extension to SYCL: provide pieces of STL container interface from mdspan.
- using value_type = std::remove_cv_t< element_type >

  Even if the buffer is read-only use a non-const type so at least the current implementation can copy the data too.
- using non_const_pointer = value_type *
- using pointer = typename mdspan::accessor_type::data_handle_type

  Pointer type to element.
- using const_pointer = const element_type *

  Pointer type to const element.
- using reference = typename mdspan::reference

  Reference type to the elements.

Public Member Functions

- accessor ()=default

  Used by the local accessor hack on top of host accessor.
- accessor (pointer data, const range< rank()> &r)

  Create an accessor of dimensions r on top of data storage.
- accessor (const mdspan &m)

  Create an accessor from another mdspan.
- void update (pointer data, const range< rank()> &r)

  Update the accessor to target somewhere else.
- auto get_range () const

  Return a range object representing the size of the buffer in terms of number of elements in each dimension as passed to the constructor.
- std::size_t get_count () const

  Returns the total number of elements in the buffer.
- std::size_t get_size () const

  Returns the size of the buffer storage in bytes.
- auto data ()

  Get the underlying storage.
- decltype(auto) tuple_indexed_access (const auto &tuple_like_indices)

  Access to an element with indices implementing a tuple interface.

Static Public Member Functions

- static auto constexpr rank ()

  Get the number of dimensions of the buffer.
- static decltype(auto) tuple_indexed_mdspan_access (auto &&some_mdspan, const auto &tuple_like_indices)

  Access to an mdspan element with indices implementing a tuple interface.

Protected Types

- using mdspan = std::mdspan< element_type, std::dextents< std::size_t, Dimensions > >

  The memory lay-out of a buffer is a dynamic multidimensional array.

Protected Member Functions

- template<typename BasicType , typename FinalType >
  const std::array< typename mdspan::size_type, rank()> & extents_cast (const detail::small_array< Basic↩
  Type, FinalType, rank()> &sa)

  Cast a SYCL range/id-like into a mdspan index array, which is an array of std::size_t into an array of std::ptrdiff_t.
- void set_access (const mdspan &a)

  Set later the mdspan associated to this accessor.

Protected Attributes

- mdspan access

  This is the multi-dimensional interface to the data that may point to either allocation in the case of storage managed by SYCL itself or to some other memory location in the case of host memory or storage<> abstraction use.

9.10.2.2.1 Member Typedef Documentation

9.10.2.2.1.1 const_pointer `template<typename T , int Dimensions>`

```
using trisycl::mixin::accessor< T, Dimensions >::const_pointer = const element_type*
```

Pointer type to const element.

Definition at line 75 of file accessor.hpp.

9.10.2.2.1.2 element_type `template<typename T , int Dimensions>`

```
using trisycl::mixin::accessor< T, Dimensions >::element_type = T
```

Extension to SYCL: provide pieces of STL container interface from mdspan.

Definition at line 31 of file accessor.hpp.

9.10.2.2.1.3 mdspan template<typename T , int Dimensions>

```
using trisycl::mixin::accessor< T, Dimensions >::mdspan = std::mdspan<element_type, std↩
::dextents<std::size_t, Dimensions> >  [protected]
```

The memory lay-out of a buffer is a dynamic multidimensional array.

Definition at line 47 of file accessor.hpp.

```
using trisycl::mixin::accessor< T, Dimensions >::non_const_pointer = value_type*
```

Definition at line 37 of file accessor.hpp.

9.10.2.2.1.5 pointer template<typename T , int Dimensions>

```
using trisycl::mixin::accessor< T, Dimensions >::pointer = typename mdspan::accessor_type↩
::data_handle_type
```

Pointer type to element.

Definition at line 72 of file accessor.hpp.

9.10.2.2.1.6 reference template<typename T , int Dimensions>

```
using trisycl::mixin::accessor< T, Dimensions >::reference = typename mdspan::reference
```

Reference type to the elements.

Definition at line 78 of file accessor.hpp.

9.10.2.2.1.7 value_type template<typename T , int Dimensions>

```
using trisycl::mixin::accessor< T, Dimensions >::value_type = std::remove_cv_t<element_type>
```

Even if the buffer is read-only use a non-const type so at least the current implementation can copy the data too.

Definition at line 34 of file accessor.hpp.

9.10.2.2.2 Constructor & Destructor Documentation

9.10.2.2.2.1 accessor() [1/3] template<typename T , int Dimensions>

```
trisycl::mixin::accessor< T, Dimensions >::accessor ( )  [default]
```

Used by the local accessor hack on top of host accessor.

9.10.2.2.2 accessor() [2/3] template<typename T , int Dimensions>

```
trisycl::mixin::accessor< T, Dimensions >::accessor (
            pointer data,
            const range< rank()> & r )  [inline]
```

Create an accessor of dimensions r on top of data storage.

Definition at line 84 of file accessor.hpp.

```
00085       :  access { data, extents_cast(r) } {}
```

9.10.2.2.3 accessor() [3/3] template<typename T , int Dimensions>

```
trisycl::mixin::accessor< T, Dimensions >::accessor (
            const mdspan & m )  [inline]
```

Create an accessor from another mdspan.

Definition at line 88 of file accessor.hpp.

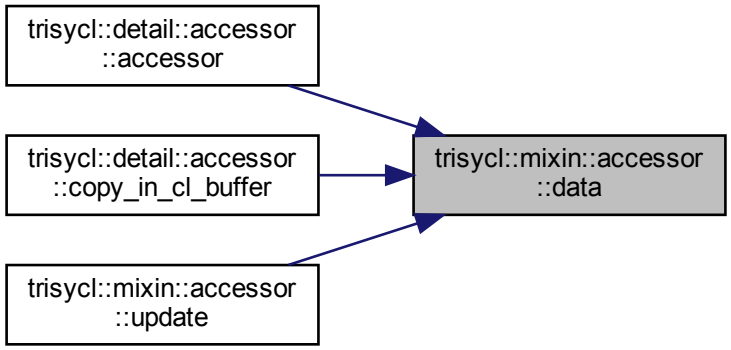
```
00089       :  access { m } {}
```

9.10.2.2.3 Member Function Documentation

9.10.2.2.3.1 data() template<typename T , int Dimensions>

```
auto trisycl::mixin::accessor< T, Dimensions >::data ( )  [inline]
```

Get the underlying storage.



Definition at line 133 of file accessor.hpp.

```
00133 { return access.data_handle(); }
```

References trisycl::mixin::accessor< T, Dimensions >::access.

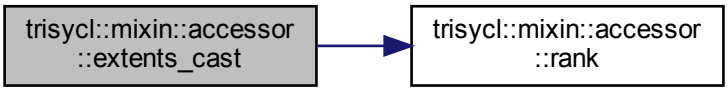
Referenced by trisycl::detail::accessor< T, Dimensions, Mode, Target >::accessor(), trisycl::detail::accessor< T, Dimensions, Mode, T
and trisycl::mixin::accessor< T, Dimensions >::update().

Here is the caller graph for this function:

9.10.2.2.3.2 extents_cast() template<typename T , int Dimensions>

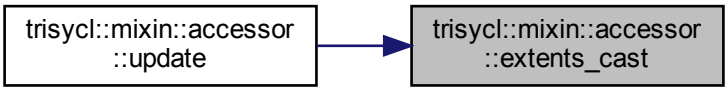
```
template<typename BasicType , typename FinalType >
const std::array< typename mdspan::size_type, rank()> & trisycl::mixin::accessor< T, Dimensions
>::extents_cast (
            const detail::small_array< BasicType, FinalType, rank()> & sa )  [inline], [protected]
```

Cast a SYCL range/id-like into a mdspan index array, which is an array of std::size_t into an array of std::ptrdiff_t.



Definition at line 62 of file accessor.hpp.

```
00062                                                                    {
00063     return reinterpret_cast<
00064         const std::array<typename mdspan::size_type, rank()>&>(sa);
00065   }
```



References trisycl::mixin::accessor< T, Dimensions >::rank().

Referenced by trisycl::mixin::accessor< T, Dimensions >::update().

Here is the caller graph for this function:

9.10.2.2.3.3 get_count() template<typename T , int Dimensions>

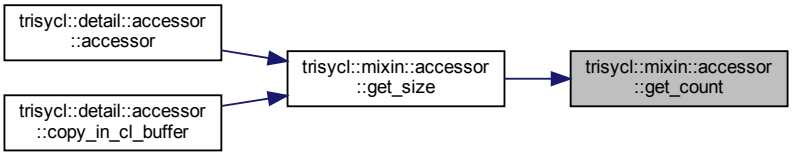
```
std::size_t trisycl::mixin::accessor< T, Dimensions >::get_count ( ) const  [inline]
```

Returns the total number of elements in the buffer.

Equal to get_range()[0] * ... * get_range()[Dimensions-1].

Todo Move these kinds of functions into a mixin between buffers and accessors?

Todo Cache it since it is const?



Definition at line 118 of file accessor.hpp.

```
00118                                {
00119     return access.mapping().required_span_size();
00120   }
```

References trisycl::mixin::accessor< T, Dimensions >::access.

Referenced by trisycl::mixin::accessor< T, Dimensions >::get_size().

Here is the caller graph for this function:

9.10.2.2.3.4 get_range() template<typename T , int Dimensions>

auto trisycl::mixin::accessor< T, Dimensions >::get_range ( ) const [inline]

Return a range object representing the size of the buffer in terms of number of elements in each dimension as passed to the constructor.

Todo Cache it since it is const?

Definition at line 102 of file accessor.hpp.

```
00102                                {
00103     range<Dimensions> r;
00104     for (std::size_t i = 0; i < Dimensions; ++i)
00105       r[i] = access.extent(i);
00106     return r;
00107   }
```

References trisycl::mixin::accessor< T, Dimensions >::access, and i.

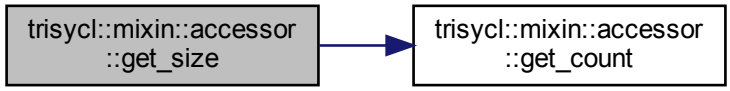
9.10.2.2.3.5 get_size() template<typename T , int Dimensions>

```
std::size_t trisycl::mixin::accessor< T, Dimensions >::get_size ( ) const  [inline]
```

Returns the size of the buffer storage in bytes.

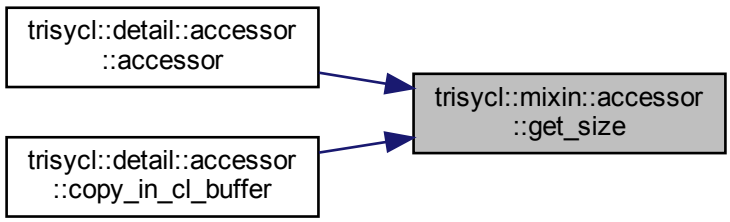
Todo rename to something else. In http://www.open-std.org/jtc1/sc22/wg21/docs/papers/2015/p0122r0.pdf it is named bytes() for example

Todo Cache it since it is const?



Definition at line 130 of file accessor.hpp.

```
00130 { return get_count() * sizeof(value_type); }
```



References trisycl::mixin::accessor< T, Dimensions >::get_count().

9.10.2.2.4 Member Data Documentation

9.10.2.2.4.1 access template<typename T , int Dimensions>

```
mdspan trisycl::mixin::accessor< T, Dimensions >::access  [protected]
```

This is the multi-dimensional interface to the data that may point to either allocation in the case of storage managed by SYCL itself or to some other memory location in the case of host memory or storage<> abstraction use.

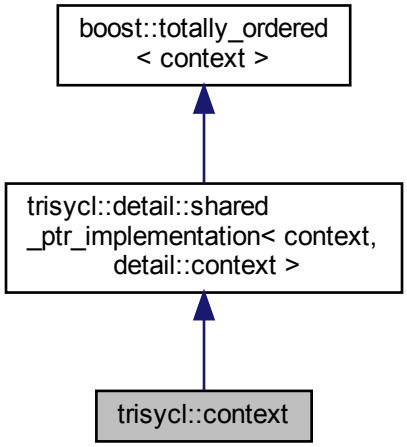
Definition at line 55 of file accessor.hpp.

Referenced by trisycl::mixin::accessor< T, Dimensions >::data(), trisycl::mixin::accessor< T, Dimensions >::get_count(), trisycl::mixin::accessor< T, Dimensions >::get_range(), trisycl::mixin::accessor< T, Dimensions >::set_access(), trisycl::mixin::accessor< T, Dimensions >::tuple_indexed_access(), and trisycl::mixin::accessor< T, Dimensions >::update().

9.10.2.3 class trisycl::context

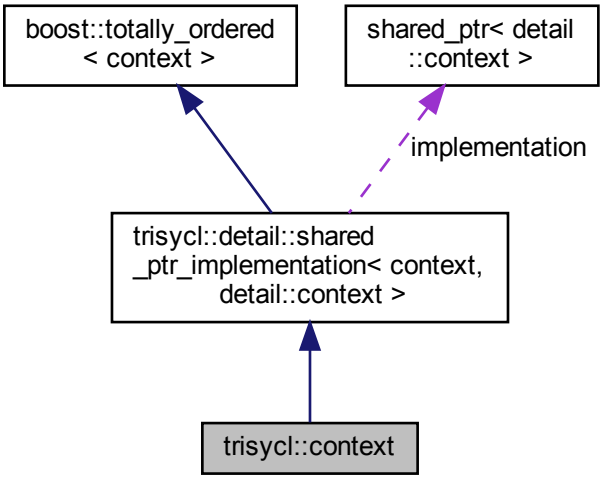
SYCL context.

The context class encapsulates an OpenCL context, which is implicitly created and the lifetime of the context instance defines the lifetime of the underlying OpenCL context instance.



On destruction clReleaseContext is called.

The default context is the SYCL host context containing only the SYCL host device.



Todo The implementation is quite minimal for now.

Definition at line 46 of file context.hpp.

Inheritance diagram for trisycl::context:

Collaboration diagram for trisycl::context:

Public Member Functions

- context (async_handler asyncHandler)

  Constructs a context object for SYCL host using an async_handler for handling asynchronous errors.
- context (cl_context clContext, async_handler asyncHandler=nullptr)

  Make a SYCL context from an OpenCL context.
- context (const boost::compute::context &c, async_handler asyncHandler=nullptr)

  Build a SYCL context from a Boost.Compute context.
- context (const device_selector &deviceSelector, async_handler asyncHandler=nullptr)

  Constructs a context object using a device_selector object.
- context (const device &dev, async_handler asyncHandler=nullptr)

  Constructs a context object using a device object.
- context (const platform &plt, async_handler asyncHandler=nullptr)

  Constructs a context object using a platform object.
- context (const vector_class< device > &deviceList, async_handler asyncHandler=nullptr)
- context ()

  Default constructor that chooses the context according the heuristics of the default selector.
- cl_context get () const

  Return the underlying `cl_context` object, after retaining the `cl_context`.
- boost::compute::context & get_boost_compute () const

  Return the underlying `boost::compute::context` of the `trisycl::context`.
- boost::compute::command_queue & get_boost_queue () const

  Return the internal queue that is associated to the context and used by triSYCL to move data between some different contests for example.
- bool is_host () const

  Specifies whether the context is in SYCL Host Execution Mode.
- platform get_platform () const

  Returns the SYCL platform that the context is initialized for.

- vector_class< device > get_devices () const

  Returns the set of devices that are part of this context.

- template<info::context param>
  auto get_info () const

  Queries OpenCL information for the under-lying cl context.

Private Types

Here is the call graph for this function:

9.10.2.3.2.2 context() [2/9] trisycl::context::context (async_handler *asyncHandler*) [inline], [explicit]

Constructs a context object for SYCL host using an async_handler for handling asynchronous errors.

Note that the default case asyncHandler = nullptr is handled by the default constructor.

Definition at line 81 of file context.hpp.

```
00082     : context { device{}, asyncHandler } {}
```

9.10.2.3.2.3 context() [3/9] trisycl::context::context (cl_context *clContext*, async_handler *asyncHandler* = *nullptr*) [inline]

Make a SYCL context from an OpenCL context.

The constructor executes a retain on the `cl_context`.

Return synchronous errors via the SYCL exception class and asynchronous errors are handled via the `async_handler`, if provided.

Definition at line 93 of file context.hpp.

```
00094     : context { boost::compute::context { clContext }, asyncHandler } {}
```

9.10.2.3.2.4 context() [4/9] trisycl::context::context (const boost::compute::context & *c*, async_handler *asyncHandler* = *nullptr*) [inline]

Build a SYCL context from a Boost.Compute context.

Definition at line 98 of file context.hpp.

```
00100     : implementation_t { detail::opencl_context::instance(c) } {}
```

9.10.2.3.2.5 context() [5/9] trisycl::context::context (const device_selector & deviceSelector, async_handler asyncHandler = nullptr) [inline]

Constructs a context object using a device_selector object.

The context is constructed with a single device retrieved from the device_selector object provided.

Return synchronous errors via the SYCL exception class and asynchronous errors are handled via the async_↩ handler, if provided.

Definition at line 111 of file context.hpp.

```
00112     : context (vector_class<device>{}, asyncHandler, deviceSelector) {}
```

9.10.2.3.2.6 context() [6/9] trisycl::context::context (const device & dev, async_handler asyncHandler = nullptr) [inline]

Constructs a context object using a device object.

Return synchronous errors via the SYCL exception class and asynchronous errors are handled via the async_↩ handler, if provided.

Definition at line 119 of file context.hpp.

```
00120     : context { vector_class<device>{dev}, asyncHandler } {}
```

9.10.2.3.2.7 context() [7/9] trisycl::context::context (const platform & plt, async_handler asyncHandler = nullptr) [inline]

Constructs a context object using a platform object.

Return synchronous errors via the SYCL exception class and asynchronous errors are handled via the async_↩ handler, if provided.

Definition at line 127 of file context.hpp.

```
00128     : context { plt.get_devices(), asyncHandler } {}
```

9.10.2.3.2.8 context() [8/9] trisycl::context::context (const vector_class< device > & deviceList, async_handler asyncHandler = nullptr)

9.10.2.3.2.9 context() [9/9] trisycl::context::context ( ) [inline]

Default constructor that chooses the context according the heuristics of the default selector.

Return synchronous errors via the SYCL exception class.

Get the default constructors back.

Definition at line 148 of file context.hpp.

```
00148 : context { async_handler {} } {}
```

9.10.2.3.3 Member Function Documentation

9.10.2.3.3.1 get() `cl_context trisycl::context::get ( ) const [inline]`

Return the underlying `cl_context` object, after retaining the `cl_context`.

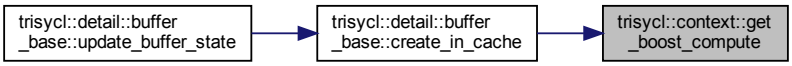
Retains a reference to the returned `cl_context` object.

Caller should release it when finished.

Definition at line 158 of file context.hpp.

```
00158                                {
00159     return implementation->get();
00160   }
```

9.10.2.3.3.2 get_boost_compute() `boost::compute::context & trisycl::context::get_boost_compute ( ) const [inline]`



Return the underlying `boost::compute::context` of the `trisycl::context`.

Definition at line 165 of file context.hpp.

```
00165                                                {

```

Referenced by trisycl::detail::buffer_base::update_buffer_state().

Here is the caller graph for this function:

9.10.2.3.3.4 get_devices() vector_class< device > trisycl::context::get_devices ( ) const [inline]

Returns the set of devices that are part of this context.

Todo To be implemented

Definition at line 198 of file context.hpp.

```
00198                                          {
00199     return implementation->get_devices();
00200   }
```

9.10.2.3.3.5 get_info() template<info::context param>

```
auto trisycl::context::get_info ( ) const  [inline]
```

Queries OpenCL information for the under-lying cl context.

Todo To be implemented

9.10.2.3.3.6 get_platform() platform trisycl::context::get_platform ( ) const [inline]

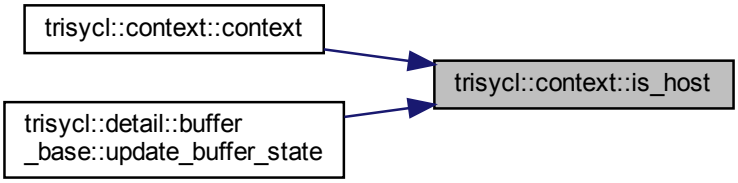
Returns the SYCL platform that the context is initialized for.

Todo To be implemented

Definition at line 189 of file context.hpp.

```
00189                                    {
00190     return implementation->get_platform();
00191   };
```

9.10.2.3.3.7 is_host() `bool trisycl::context::is_host ( ) const [inline]`

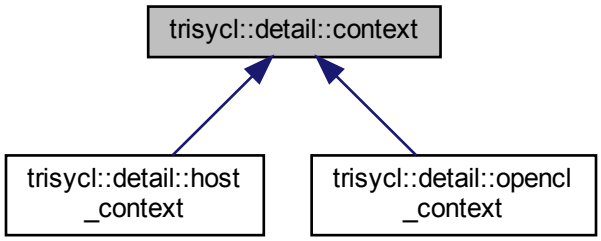


Specifies whether the context is in SYCL Host Execution Mode.

Definition at line 180 of file context.hpp.

```
00180                          {
00181     return implementation->is_host();
00182   }
```

Referenced by context(), and trisycl::detail::buffer_base::update_buffer_state().



Here is the caller graph for this function:

9.10.2.4 class trisycl::detail::context

Definition at line 22 of file context.hpp.

Inheritance diagram for trisycl::detail::context:

Public Member Functions

- virtual cl_context get () const =0

  Return the underlying `cl_context` of the `trisycl::context`.
- virtual boost::compute::context & get_boost_compute ()=0

  Return the underlying `boost::compute::context` of the `trisycl::context`.

- virtual boost::compute::command_queue & get_boost_queue ()=0

  Return the underlying `boost::compute::command_queue` *associated with the context.*
- virtual bool is_host () const =0

  Returns true is the context is a SYCL host context.
- virtual trisycl::platform get_platform () const =0

  Returns the SYCL platform that the context is initialized for.
- virtual vector_class< trisycl::device > get_devices () const =0

  Returns the set of devices that are part of this context.
- virtual trisycl::cl_uint get_reference_count () const =0

  Returns the reference count of underlying CL context, or 0 on host.
- virtual ~context ()

  Virtual to call the real destructor.

9.10.2.4.1 Constructor & Destructor Documentation

9.10.2.4.1.1 ~context() `virtual trisycl::detail::context::~context ( ) [inline], [virtual]`

Virtual to call the real destructor.

Definition at line 59 of file context.hpp.

```
00059 {}
```

9.10.2.4.2 Member Function Documentation

9.10.2.4.2.1 get() `virtual cl_context trisycl::detail::context::get ( ) const [pure virtual]`

Return the underlying `cl_context` of the `trisycl::context`.

Implemented in trisycl::detail::host_context, and trisycl::detail::opencl_context.

9.10.2.4.2.2 get_boost_compute() `virtual boost::compute::context & trisycl::detail::context::get_boost_compute ( ) [pure virtual]`

Return the underlying `boost::compute::context` of the `trisycl::context`.

Implemented in trisycl::detail::host_context, and trisycl::detail::opencl_context.

9.10.2.4.2.3 get_boost_queue() `virtual boost::compute::command_queue & trisycl::detail::context::get_boost_queue ( ) [pure virtual]`

Return the underlying `boost::compute::command_queue` associated with the context.

Implemented in trisycl::detail::host_context, and trisycl::detail::opencl_context.

9.10.2.4.2.4 get_devices() virtual vector_class< trisycl::device > trisycl::detail::context::get_devices ( ) const [pure virtual]

Returns the set of devices that are part of this context.

Todo virtual cannot be templated template <info::context Param> typename info::param_traits<info::context, Param>::type get_info() const = 0;

Implemented in trisycl::detail::host_context, and trisycl::detail::opencl_context.

9.10.2.4.2.5 get_platform() virtual trisycl::platform trisycl::detail::context::get_platform ( ) const [pure virtual]

Returns the SYCL platform that the context is initialized for.

Implemented in trisycl::detail::host_context, and trisycl::detail::opencl_context.

9.10.2.4.2.6 get_reference_count() virtual trisycl::cl_uint trisycl::detail::context::get_reference_count ( ) const [pure virtual]

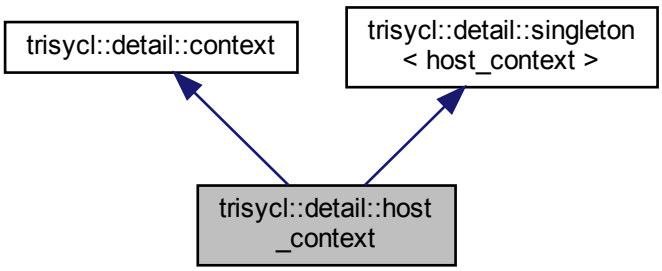
Returns the reference count of underlying CL context, or 0 on host.

Implemented in trisycl::detail::host_context, and trisycl::detail::opencl_context.

9.10.2.4.2.7 is_host() virtual bool trisycl::detail::context::is_host ( ) const [pure virtual]

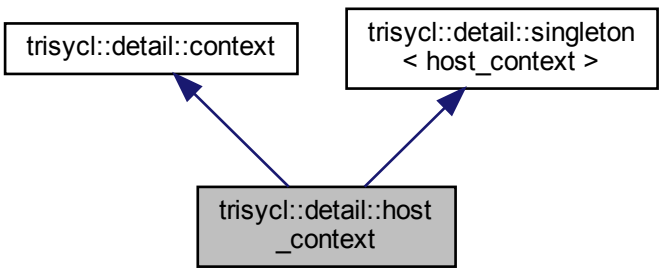
Returns true is the context is a SYCL host context.

Implemented in trisycl::detail::host_context, and trisycl::detail::opencl_context.



9.10.2.5 class trisycl::detail::host_context

SYCL host context.



Todo The implementation is quite minimal for now. :-)

Definition at line 31 of file host_context.hpp.

Inheritance diagram for trisycl::detail::host_context:

Collaboration diagram for trisycl::detail::host_context:

Public Member Functions

- cl_context get () const override

  Return the underlying `cl_context` of the `trisycl::context`.
- boost::compute::context & get_boost_compute () override

  Return the SYCL platform that the context is initialized for.
- boost::compute::command_queue & get_boost_queue () override

  Return the internal OpenCL queue that is associated to the host context.

- bool is_host () const override

  Return true since the context is a SYCL host context.
- trisycl::platform get_platform () const override

  Return the platform of the context.
- vector_class< trisycl::device > get_devices () const override

  Returns the set of devices that are part of this context.
- trisycl::cl_uint get_reference_count () const override

  Return 0 since the context is a SYCL host context.

Additional Inherited Members

9.10.2.5.1 Member Function Documentation

9.10.2.5.1.1 get() `cl_context trisycl::detail::host_context::get ( ) const [inline], [override], [virtual]`

Return the underlying `cl_context` of the `trisycl::context`.

This throws an error since there is no OpenCL context associated to the host device.

Implements trisycl::detail::context.

Definition at line 42 of file host_context.hpp.

```
00042                                  {
00043     throw non_cl_error("The host context has no OpenCL context");
00044   }
```

9.10.2.5.1.2 get_boost_compute() `boost::compute::context & trisycl::detail::host_context::get↩_boost_compute ( ) [inline], [override], [virtual]`

Return the SYCL platform that the context is initialized for.

This throws an error since there is no `boost::compute` context associated to the host device.

Implements trisycl::detail::context.

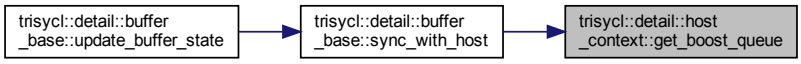
Definition at line 52 of file host_context.hpp.

```
00052                                                  {
00053     throw non_cl_error("The host context has no OpenCL context");
00054   }
```

9.10.2.5.1.3 get_boost_queue() boost::compute::command_queue & trisycl::detail::host_context::get_boost_queue ( ) [inline], [override], [virtual]

Return the internal OpenCL queue that is associated to the host context.

This throws an error since there is no boost::compute::command_queue associated to the host context.



Implements trisycl::detail::context.

Definition at line 63 of file host_context.hpp.

```
00063                                                 {
00064     throw non_cl_error("The host context cannot have an OpenCL queue");
00065   }
```

Referenced by trisycl::detail::buffer_base::sync_with_host().

Here is the caller graph for this function:

9.10.2.5.1.4 get_devices() vector_class< trisycl::device > trisycl::detail::host_context::get_devices ( ) const [inline], [override], [virtual]

Returns the set of devices that are part of this context.

It should only return the host device itself.

Todo To be implemented

Implements trisycl::detail::context.

Definition at line 106 of file host_context.hpp.

```
00106                                       {
00107     // Return just the host device
00108     return { {} };
00109   }
```

9.10.2.5.1.5 get_platform() trisycl::platform trisycl::detail::host_context::get_platform ( ) const [inline], [override], [virtual]

Return the platform of the context.

Return synchronous errors via the SYCL exception class.

Implements trisycl::detail::context.

Definition at line 79 of file host_context.hpp.

```
00079                                           {
00080     // Return the host platform
00081     return {};
00082   }
```

9.10.2.5.1.6 get_reference_count() trisycl::cl_uint trisycl::detail::host_context::get_reference↩ _count ( ) const [inline], [override], [virtual]

Return 0 since the context is a SYCL host context.

Implements trisycl::detail::context.

Definition at line 112 of file host_context.hpp.

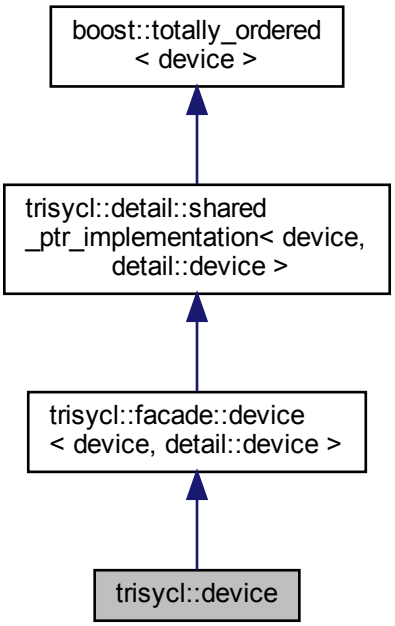
```
00112                                                  {
00113     return 0;
00114   }
```

9.10.2.5.1.7 is_host() bool trisycl::detail::host_context::is_host ( ) const [inline], [override], [virtual]

Return true since the context is a SYCL host context.

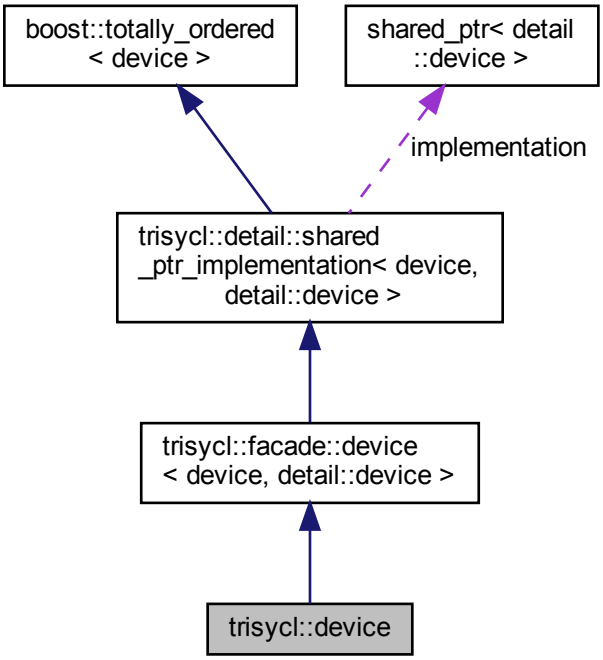
Implements trisycl::detail::context.

Definition at line 70 of file host_context.hpp.



```
00070                                  {
00071     return true;
00072   }
```

9.10.2.6 class trisycl::device



SYCL device.

Definition at line 44 of file device.hpp.

Inheritance diagram for trisycl::device:

Collaboration diagram for trisycl::device:

Public Member Functions

- device ()

  The default constructor uses the SYCL host device.
- device (cl_device_id device_id)

  Construct a device class instance using cl_device_id of the OpenCL device.
- device (const boost::compute::device &d)

  Construct a device class instance using a boost::compute::device.
- device (const device_selector &ds)

  Construct a device class instance using the device selector provided.
- cl_device_id get () const

  Return the cl_device_id of the underlying OpenCL platform.
- boost::compute::device get_boost_compute () const

  Return the underlying Boost.Compute device if it is an OpenCL device.
- bool is_host () const

  Return true if the device is the SYCL host device.
- bool is_cpu () const

  Return true if the device is an OpenCL CPU device.
- bool is_gpu () const

  Return true if the device is an OpenCL GPU device.
- bool is_accelerator () const

  Return true if the device is an OpenCL accelerator device.
- info::device_type type () const

Return the device_type of a device.

- platform get_platform () const

  Return the platform of device.

- template<info::device param>
  info::param_traits< info::device, param >::return_type get_info () const

  Query the device for OpenCL info::device info.

- bool has_extension (const string_class &extension) const

  Test if a specific extension is supported on the device.

- template<info::partition_property prop>
  vector_class< device > create_sub_devices (size_t nbSubDev) const
- template<info::partition_property prop>
  vector_class< device > create_sub_devices (const vector_class< size_t > &counts) const
- template<info::partition_property prop>
  vector_class< device > create_sub_devices (info::partition_affinity_domain affinityDomain) const

Static Public Member Functions

- static vector_class< device > get_devices (info::device_type device_type=info::device_type::all) TRISYCL_WEAK_ATTRIB_SU

  Return a list of all available devices.

Private Types

- using implementation_t = facade::device< device, detail::device >

Additional Inherited Members

9.10.2.6.1 Member Typedef Documentation

9.10.2.6.1.1 implementation_t `using trisycl::device::implementation_t = facade::device<device, detail::device> [private]`

Definition at line 50 of file device.hpp.

9.10.2.6.2 Constructor & Destructor Documentation

9.10.2.6.2.1 device() [1/4] `trisycl::device::device ( ) [inline]`

The default constructor uses the SYCL host device.

Definition at line 58 of file device.hpp.

```
00058 : implementation_t { detail::host_device::instance() } {}
```

9.10.2.6.2.2 device() [2/4] trisycl::device::device (cl_device_id *device_id*) [inline]

Construct a device class instance using cl_device_id of the OpenCL device.

Return synchronous errors via the SYCL exception class.

Retain a reference to the OpenCL device and if this device was an OpenCL subdevice the device should be released by the caller when it is no longer needed.

Definition at line 71 of file device.hpp.

```
00072     : device { boost::compute::device { device_id } } {}
```

9.10.2.6.2.3 device() [3/4] trisycl::device::device (const boost::compute::device & *d*) [inline]

Construct a device class instance using a boost::compute::device.

This is a triSYCL extension for boost::compute interoperation.

Return synchronous errors via the SYCL exception class.

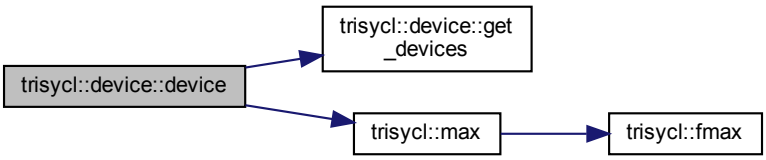
Definition at line 81 of file device.hpp.

```
00082     : implementation_t { detail::opencl_device::instance(d) } {}
```

9.10.2.6.2.4 device() [4/4] trisycl::device::device (const device_selector & *ds*) [inline], [explicit]

Construct a device class instance using the device selector provided.

Return errors via C++ exception class.



Todo Make it non-explicit in the specification?

Definition at line 93 of file device.hpp.

```
00093                                                {
00094     auto devices = device::get_devices();
00095     if (devices.empty())
00096       // \todo Put a SYCL exception
00097       throw std::domain_error("No device at all!  Internal error...");
00098
00099     /* Find the device with the best score according to the given
00100 device_selector */
00101     auto max = std::max_element(devices.cbegin(), devices.cend(),
00102                                 [&] (const device &d1, const device &d2) {
00103                                   return ds(d1) < ds(d2);
00104                                 });
00105     if (ds(*max) < 0)
00106       // \todo Put a SYCL exception
00107       throw std::domain_error("No device selected because no positive "
00108                               "device_selector score found");
00109
00110     // Create the current device as a shared copy of the selected one
00111     implementation = max->implementation;
00112   }
```

9.10.2.7 class trisycl::detail::device

An abstract class representing various models of SYCL devices.

Definition at line 23 of file device.hpp.

Inheritance diagram for trisycl::detail::device:

Public Member Functions

- virtual cl_device_id get () const =0

  Return the cl_device_id of the underlying OpenCL platform.
- virtual boost::compute::device & get_boost_compute ()=0

  Return the underlying Boost.Compute device, if any.
- virtual bool is_host () const =0

  Return true if the device is a SYCL host device.
- virtual bool is_cpu () const =0

  Return true if the device is an OpenCL CPU device.
- virtual bool is_gpu () const =0

  Return true if the device is an OpenCL GPU device.
- virtual bool is_accelerator () const =0

  Return true if the device is an OpenCL accelerator device.
- virtual trisycl::platform get_platform () const =0

  Return the platform of device.
- virtual std::any get_info (info::device param) const =0

  Query the device for OpenCL info::device info.
- virtual bool has_extension (const string_class &extension) const =0

  Specify whether a specific extension is supported on the device.
- virtual ~device ()

9.10.2.7.1 Constructor & Destructor Documentation

9.10.2.7.1.1 ~device() `virtual trisycl::detail::device::~device ( ) [inline], [virtual]`

Definition at line 65 of file device.hpp.

```
00065 {}
```

9.10.2.7.2 Member Function Documentation

9.10.2.7.2.1 get() `virtual cl_device_id trisycl::detail::device::get ( ) const [pure virtual]`

Return the cl_device_id of the underlying OpenCL platform.

Implemented in trisycl::detail::host_device, and trisycl::detail::opencl_device.

9.10.2.7.2.2 get_boost_compute() `virtual boost::compute::device & trisycl::detail::device::get_boost_compute ( ) [pure virtual]`

Return the underlying Boost.Compute device, if any.

Implemented in trisycl::detail::host_device, and trisycl::detail::opencl_device.

9.10.2.7.2.3 get_info() `virtual std::any trisycl::detail::device::get_info ( info::device param ) const [pure virtual]`

Query the device for OpenCL info::device info.

Implemented in trisycl::detail::host_device, and trisycl::detail::opencl_device.

9.10.2.7.2.4 get_platform() `virtual trisycl::platform trisycl::detail::device::get_platform ( ) const [pure virtual]`

Return the platform of device.

Implemented in trisycl::detail::host_device, and trisycl::detail::opencl_device.

9.10.2.7.2.5 has_extension() `virtual bool trisycl::detail::device::has_extension ( const string_class & extension ) const [pure virtual]`

Specify whether a specific extension is supported on the device.

Implemented in trisycl::detail::host_device, and trisycl::detail::opencl_device.

9.10.2.7.2.6 is_accelerator() `virtual bool trisycl::detail::device::is_accelerator ( ) const [pure virtual]`

Return true if the device is an OpenCL accelerator device.

Implemented in trisycl::detail::host_device, and trisycl::detail::opencl_device.

9.10.2.7.2.7 is_cpu() virtual bool trisycl::detail::device::is_cpu ( ) const [pure virtual]

Return true if the device is an OpenCL CPU device.

Implemented in trisycl::detail::host_device, and trisycl::detail::opencl_device.

9.10.2.7.2.8 is_gpu() virtual bool trisycl::detail::device::is_gpu ( ) const [pure virtual]

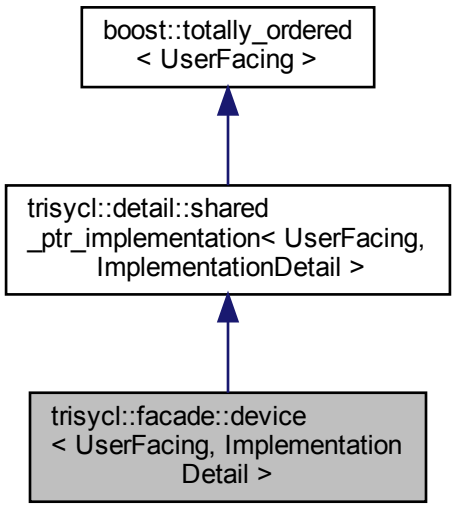
Return true if the device is an OpenCL GPU device.

Implemented in trisycl::detail::host_device, and trisycl::detail::opencl_device.

9.10.2.7.2.9 is_host() virtual bool trisycl::detail::device::is_host ( ) const [pure virtual]

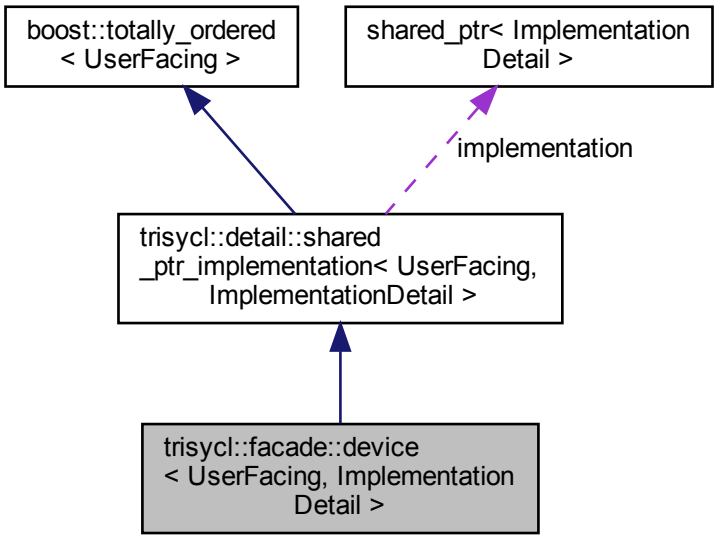
Return true if the device is a SYCL host device.

Implemented in trisycl::detail::host_device, and trisycl::detail::opencl_device.



9.10.2.8 class trisycl::facade::device

template<typename UserFacing, typename ImplementationDetail>
class trisycl::facade::device< UserFacing, ImplementationDetail >



SYCL device.

Definition at line 21 of file device.hpp.

Inheritance diagram for trisycl::facade::device< UserFacing, ImplementationDetail >:

Collaboration diagram for trisycl::facade::device< UserFacing, ImplementationDetail >:

Public Types

- using implementation_t = detail::shared_ptr_implementation< UserFacing, ImplementationDetail >
  The type encapsulating the implementation.
- using detail_t = ImplementationDetail
  The real detail type doing the work behind the scene.

Additional Inherited Members

9.10.2.8.1 Member Typedef Documentation

9.10.2.8.1.1 detail_t

```
template<typename UserFacing , typename ImplementationDetail >
using trisycl::facade::device< UserFacing, ImplementationDetail >::detail_t = Implementation↩
Detail
```

The real detail type doing the work behind the scene.

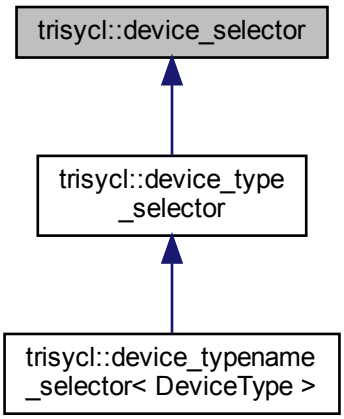
Definition at line 33 of file device.hpp.

9.10.2.8.1.2 implementation_t

```
template<typename UserFacing , typename ImplementationDetail >
using trisycl::facade::device< UserFacing, ImplementationDetail >::implementation_t = detail::shared_ptr_impl
Facing, ImplementationDetail>
```

The type encapsulating the implementation.

Definition at line 29 of file device.hpp.



9.10.2.9 class trisycl::device_selector

The SYCL heuristics to select a device.

The device with the highest score is selected

Definition at line 22 of file device_selector.hpp.

Inheritance diagram for trisycl::device_selector:

Public Member Functions

- device select_device () const

  Returns a selected device using the functor operator defined in sub-classes operator()(const device &dev)
- virtual int operator() (const device &dev) const =0

  This pure virtual operator allows the customization of device selection.
- virtual ~device_selector ()

  Virtual destructor so the final destructor can be called if any.

Private Member Functions

- device select_device (vector_class< platform > platforms) const

9.10.2.9.1 Constructor & Destructor Documentation

9.10.2.9.1.1 ~device_selector() `virtual trisycl::device_selector::~device_selector ( ) [inline], [virtual]`

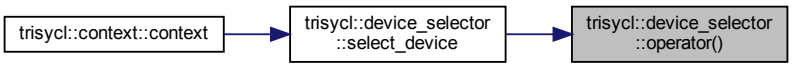
Virtual destructor so the final destructor can be called if any.

Definition at line 46 of file device_selector.hpp.

```
00046 {}
```

9.10.2.9.2 Member Function Documentation

9.10.2.9.2.1 operator()() `virtual int trisycl::device_selector::operator() ( const device & dev ) const [pure virtual]`



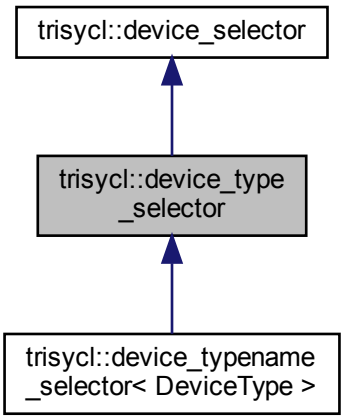
This pure virtual operator allows the customization of device selection.

It defines the behavior of the device_selector functor called by the SYCL runtime on device selection. It returns a "score" for each device in the system and the highest rated device will be used by the SYCL runtime.

Implemented in trisycl::device_type_selector.

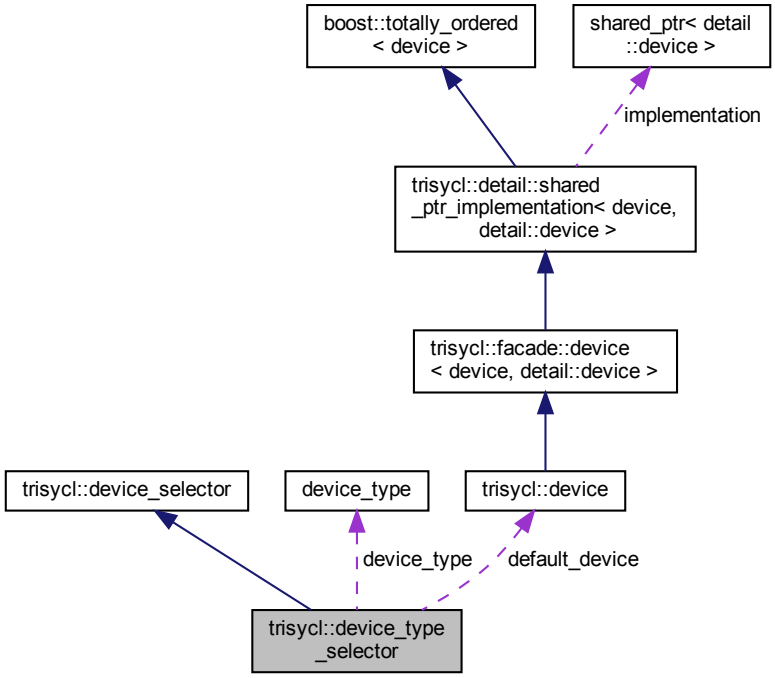
Referenced by select_device().

Here is the caller graph for this function:



9.10.2.10 class trisycl::device_type_selector

A device selector by device_type.



Todo To be added to the specification

Definition at line 54 of file device_selector_tail.hpp.

Inheritance diagram for trisycl::device_type_selector:

Collaboration diagram for trisycl::device_type_selector:

Public Member Functions

- device_type_selector (info::device_type device_type)
- int operator() (const device &dev) const override

  This pure virtual operator allows the customization of device selection.

Private Attributes

- info::device_type device_type

  The device_type to select.
- device default_device

  Cache the default device to select with the default device selector.

9.10.2.10.1 Constructor & Destructor Documentation

9.10.2.10.1.1 device_type_selector() `trisycl::device_type_selector::device_type_selector ( info::device_type device_type ) [inline]`

Definition at line 70 of file device_selector_tail.hpp.

```
00071     :  device_type { device_type } {
00072     // The default device selection heuristic
00073 #ifdef TRISYCL_OPENCL

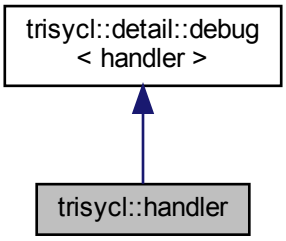
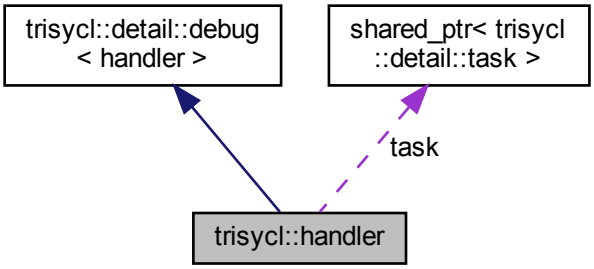
9.10.2.12 class trisycl::handler



Command group handler class.

A command group handler object can only be constructed by the SYCL runtime.



All of the accessors defined in the command group scope take as a parameter an instance of the command group handler and all the kernel invocation functions are methods of this class.

Definition at line 46 of file handler.hpp.

Inheritance diagram for trisycl::handler:

Collaboration diagram for trisycl::handler:

Public Member Functions

- handler (const std::shared_ptr< detail::queue > &q)
- template<typename DataType , int Dimensions, access::mode Mode, access::target Target = access::target::global_buffer>
  void set_arg (int arg_index, accessor< DataType, Dimensions, Mode, Target > &&acc_obj)

  Set accessor kernel arg for an OpenCL kernel which is used through the SYCL/OpenCL interop interface.
- template<typename T , typename = std::enable_if_t<is_wrapper<T>::value>>
  void set_arg (int arg_index, T &&scalar_value)

  Set kernel args for an OpenCL kernel which is used through the SYCL/OpenCL interoperability interface with a wrapper type.
- template<typename T >
  std::enable_if_t<!is_wrapper< T >::value > set_arg (int arg_index, T &&scalar_value)

  Set kernel args for an OpenCL kernel which is used through the SYCL/OpenCL interoperability interface without a wrapper type.

- template<typename... Ts>
  void set_args (Ts &&... args)

  Set all kernel args for an OpenCL kernel which is used through the SYCL/OpenCL interop interface.
- template<typename KernelName = std::nullptr_t, typename ParallelForFunctor >
  void single_task (ParallelForFunctor &&f)

  Kernel invocation method of a kernel defined as a lambda or functor.
- template<typename KernelName = std::nullptr_t, int Dims, typename ParallelForFunctor >
  requires (!std::derived_from<ParallelForFunctor, kernel>)
  void parallel_for (const range< Dims > &global_size, ParallelForFunctor f)

  SYCL parallel_for launches a data parallel computation with parallelism specified at launch time by a range<>
- template<typename KernelName = std::nullptr_t, int Dims, typename ParallelForFunctor >
  void parallel_for (const std::size_t(&global_size)[Dims], ParallelForFunctor f)

  SYCL parallel_for launches a data parallel computation with parallelism specified at launch time with a range defined with a { dim1, dim2, dim3... } syntax.
- template<typename KernelName = std::nullptr_t, typename ParallelForFunctor >
  requires (!std::derived_from<ParallelForFunctor, kernel>)
  void parallel_for (std::size_t global_size, ParallelForFunctor f)

  SYCL parallel_for launches a data parallel computation with parallelism specified at launch time with a range defined with a single dimension as an integer.
- template<typename KernelName = std::nullptr_t, int Dims, typename ParallelForFunctor >
  void parallel_for (range< Dims > global_size, id< Dims > offset, ParallelForFunctor f)

  Kernel invocation method of a kernel defined as a lambda or functor, for the specified range and offset and given an id or item for indexing in the indexing space defined by range.
- template<typename KernelName = std::nullptr_t, int Dimensions, typename ParallelForFunctor >
  void parallel_for (nd_range< Dimensions > r, ParallelForFunctor f)

  Kernel invocation method of a kernel defined as a lambda or functor, for the specified nd_range and given an nd_item for indexing in the indexing space defined by the nd_range.
- template<typename KernelName = std::nullptr_t, int Dimensions = 1, typename ParallelForFunctor >
  void parallel_for_work_group (nd_range< Dimensions > r, ParallelForFunctor f)

  Hierarchical kernel invocation method of a kernel defined as a lambda encoding the body of each work-group to launch.
- template<typename KernelName = std::nullptr_t, int Dimensions = 1, typename ParallelForFunctor >
  void parallel_for_work_group (range< Dimensions > r1, range< Dimensions > r2, ParallelForFunctor f)

  Hierarchical kernel invocation method of a kernel defined as a lambda encoding the body of each work-group to launch.
- void single_task (kernel sycl_kernel)

  Kernel invocation method of a kernel defined as pointer to a kernel object, described in detail in 3.5.3.
- template<int Dimensions = 1, typename SYCLrange >
  requires (std::derived_from<SYCLrange, range<Dimensions>> || std::integral<SYCLrange>)
  void parallel_for (SYCLrange num_work_items, kernel sycl_kernel)

  Kernel invocation method of a kernel defined as a kernel object, for the specified range and given an id or item for indexing in the indexing space defined by range, described in detail in 5.4.
- template<int Dimensions = 1>
  void parallel_for (nd_range< Dimensions >, kernel syclKernel)

  Kernel invocation method of a kernel defined as pointer to a kernel object, for the specified nd_range and given an nd_item for indexing in the indexing space defined by the nd_range, described in detail in 3.5.3.

Public Attributes

- std::shared_ptr< detail::task > task

  Attach the task and accessors to it.

Private Member Functions

- template<std::size_t... Is, typename... Ts>
  void dispatch_set_arg (std::index_sequence< Is... >, Ts &&... args)

  Helper to individually call set_arg() for each argument.
- template<typename KernelName , typename Kernel >
  void schedule_kernel (Kernel k)

  Schedule the kernel.
- template<typename KernelName , typename Kernel , int N>
  void schedule_parallel_for_kernel (Kernel k, const range< N > &num_work_items)

  Schedule a parallel for kernel.

9.10.2.12.2.2 parallel_for() [1/7]

```
template<typename KernelName = std::nullptr_t, int Dims, typename
ParallelForFunctor >
requires (!std::derived_from<ParallelForFunctor, kernel>)
void trisycl::handler::parallel_for (
            const range< Dims > & global_size,
            ParallelForFunctor f )  [inline]
```

SYCL parallel_for launches a data parallel computation with parallelism specified at launch time by a range<>

Kernel invocation method of a kernel defined as a lambda or functor, for the specified range and given an id or item for indexing in the indexing space defined by range.

If it is a lambda function or the if the functor type is globally visible there is no need for the developer to provide a kernel name type (typename KernelName) for it.

Parameters

global_size	is the full size of the range<>

Template Parameters

Dims	dimensionality of the iteration space
KernelName	is a class type that defines the name to be used for the underlying kernel

Parameters

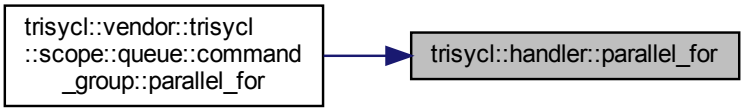
f	is the kernel functor to execute

Template Parameters

ParallelForFunctor	is the type of the kernel functor

Definition at line 264 of file handler.hpp.

```
00264                                                                                {
00265     if constexpr (detail::use_native_work_item) {
00266       // Use a normal parallel for
00267       schedule_parallel_for_kernel<KernelName>(
00268           [=] { detail::parallel_for(global_size, f); }, global_size);
00269     } else
00270       // Launch a single-task kernel containing the loop nests
00271       schedule_kernel<KernelName>(
00272           [=] { detail::parallel_for(global_size, f); });
00273   }
```



References trisycl::detail::parallel_for(), and trisycl::detail::use_native_work_item.

Here is the call graph for this function:

Here is the caller graph for this function:

9.10.2.12.2.3 parallel_for() [2/7]

```
template<typename KernelName = std::nullptr_t, int Dims, typename
ParallelForFunctor >
void trisycl::handler::parallel_for (
            const std::size_t(&) global_size[Dims],
            ParallelForFunctor f )  [inline]
```

SYCL parallel_for launches a data parallel computation with parallelism specified at launch time with a range defined with a { dim1, dim2, dim3... } syntax.

Kernel invocation method of a kernel defined as a lambda or functor, for the specified range and given an id or item for indexing in the indexing space defined by range.

If it is a lambda function or the if the functor type is globally visible there is no need for the developer to provide a kernel name type (typename KernelName) for it.

Parameters

global_size	is the full size of the range<> defined as a C array to allow type deduction from a list-initialization with { args... }

Template Parameters

Dims	dimensionality of the iteration space
KernelName	is a class type that defines the name to be used for the underlying kernel

Parameters

f	is the kernel functor to execute

Template Parameters

ParallelForFunctor	is the type of the kernel functor

Definition at line 302 of file handler.hpp.

```
00303                                          {

template<typename DataType , int Dimensions, access::mode Mode,
access::target Target = access::target::global_buffer>
void trisycl::handler::set_arg (
             int arg_index,
             accessor< DataType, Dimensions, Mode, Target > && acc_obj )  [inline]
```

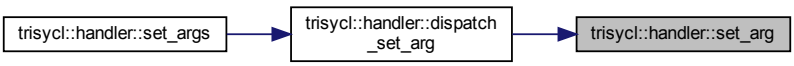
Set accessor kernel arg for an OpenCL kernel which is used through the SYCL/OpenCL interop interface.

The index value specifies which parameter of the OpenCL kernel is being set and the accessor object, which OpenCL buffer or image is going to be given as kernel argument.

Todo Update the specification to use a ref && to the accessor instead?

Todo It is not that clean to have set_arg() associated to a command handler. Rethink the specification?

Todo It seems more logical to have these methods on kernel instead



Definition at line 89 of file handler.hpp.

```
00090                                                                    {
00091     /* Think about setting the kernel argument before actually calling
00092 the kernel.
00093
00094 Explicitly capture task by copy instead of having this captured
00095 by reference and task by reference by side effect */
00096     task->add_prelude([=, task = task] {
00097         task->set_arg(arg_index, acc_obj.implementation->get_cl_buffer());
00098       });
00099   }
```

References task.

9.10.2.12.2.17 single_task() [1/2] void trisycl::handler::single_task (

```
            kernel sycl_kernel ) [inline]
```

Kernel invocation method of a kernel defined as pointer to a kernel object, described in detail in 3.5.3.

Todo Add in the spec a version taking a kernel and a functor, to have host fall-back

Definition at line 462 of file handler.hpp.

```
00462                                    {
00463     /* For now just use the usual host task system to schedule
00464 manually the OpenCL kernels instead of using OpenCL event-based
00465 scheduling
00466
00467 \todo Move the tracing inside the kernel implementation
00468
00469 \todo Simplify this 2 step ugly interface
00470 */
00471     task->set_kernel(sycl_kernel.implementation);
00472     task->schedule(detail::trace_kernel<kernel>([=, t = task] {
00473           sycl_kernel.implementation->single_task(t, t->get_queue());
00474         }));
00475   }
```

References trisycl::detail::shared_ptr_implementation< Parent, Implementation >::implementation, and task.

9.10.2.12.2.18 single_task() [2/2] template<typename KernelName = std::nullptr_t, typename Parallel↩ ForFunctor >

```
void trisycl::handler::single_task (
            ParallelForFunctor && f ) [inline]
```

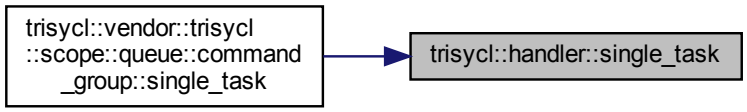
Kernel invocation method of a kernel defined as a lambda or functor.

If it is a lambda function or the functor type is globally visible there is no need for the developer to provide a kernel name type (typename KernelName) for it, as described in 3.5.3

SYCL single_task launches a computation without parallelism at launch time.

Parameters

F	specify the kernel to be launched as a single_task
KernelName	is a class type that defines the name to be used for the underlying kernel



Definition at line 231 of file handler.hpp.

```
00231                                          {
00232     TRISYCL_DUMP_T("single_task &f = " « (void *) &f);
00233
00234     schedule_kernel<KernelName>(std::forward<ParallelForFunctor>(f));
00235   }
```

References TRISYCL_DUMP_T.

9.10.2.15.1 Constructor & Destructor Documentation

9.10.2.15.1.1 platform() [1/4] trisycl::platform::platform ( ) [inline]

Default constructor for platform which is the host platform.

Returns errors via the SYCL exception class.

Definition at line 57 of file platform.hpp.

```
00057             :
00058     shared_ptr_implementation { detail::host_platform::instance() } {}
```

9.10.2.15.1.2 platform() [2/4] trisycl::platform::platform (cl_platform_id *platform_id*) [inline], [explicit]

Construct a platform class instance using cl_platform_id of the OpenCL device.

Return synchronous errors via the SYCL exception class.

Retain a reference to the OpenCL platform.

Definition at line 69 of file platform.hpp.

```
00070     :  platform { boost::compute::platform { platform_id } } {}
```

9.10.2.15.1.3 platform() [3/4] trisycl::platform::platform (const boost::compute::platform & *p*) [inline]

Construct a platform class instance using a boost::compute::platform.

This is a triSYCL extension for boost::compute interoperation.

Return synchronous errors via the SYCL exception class.

Definition at line 79 of file platform.hpp.

```
00080     :  shared_ptr_implementation { detail::opencl_platform::instance(p) } {}
```

9.10.2.15.1.4 platform() [4/4] trisycl::platform::platform (const device_selector & *dev_selector*) [explicit]

Construct a platform object from the device selected by a device selector of the user's choice.

Returns errors via the SYCL exception class.

9.10.2.15.2 Member Function Documentation

9.10.2.15.2.1 get() `cl_platform_id trisycl::platform::get ( ) const [inline]`

Returns the cl_platform_id of the underlying OpenCL platform.

If the platform is not a valid OpenCL platform, for example if it is the SYCL host, an exception is thrown

Todo Define a SYCL exception for this

Definition at line 99 of file platform.hpp.

```
00099                                {

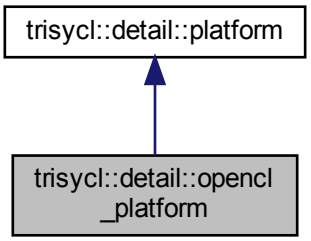
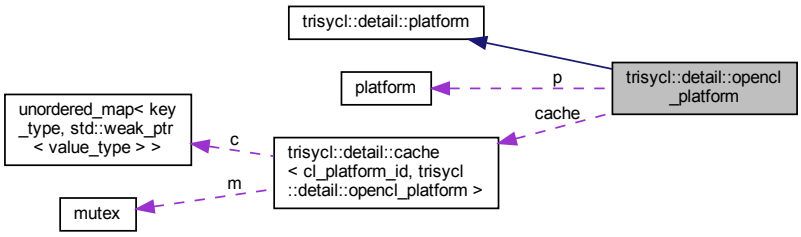
9.10.2.16.2.1 platform_extensions vector_class<string_class> trisycl::detail::host_platform::platform_extensions { "Xilinx_blocking_pipes" } [private]

Definition at line 41 of file host_platform.hpp.



Referenced by get_extension_strings(), and has_extension().

9.10.2.17 class trisycl::detail::opencl_platform



SYCL OpenCL platform.

Definition at line 34 of file opencl_platform.hpp.

Inheritance diagram for trisycl::detail::opencl_platform:

Collaboration diagram for trisycl::detail::opencl_platform:

Public Member Functions

- cl_platform_id get () const override

  Return the cl_platform_id of the underlying OpenCL platform.
- const boost::compute::platform & get_boost_compute () const override

  Return the underlying Boost.Compute platform.
- bool is_host () const override

  Return false since an OpenCL platform is not the SYCL host platform.
- string_class get_info_string (info::platform param) const override

  Returning the information string parameters for the OpenCL platform.
- vector_class< string_class > get_extension_strings () const override
- bool has_extension (const string_class &extension) const override

  Specify whether a specific extension is supported on the platform.
- vector_class< trisycl::device > get_devices (const device_selector &device_selector) const override

  Get all the available devices for this OpenCL platform.
- ~opencl_platform () override

  Unregister from the cache on destruction.

Static Public Member Functions

- static std::shared_ptr< opencl_platform > instance (const boost::compute::platform &p)

Private Member Functions

- opencl_platform (const boost::compute::platform &p)

  Only the instance factory can built it.

Private Attributes

- boost::compute::platform p

  Use the Boost Compute abstraction of the OpenCL platform.

Static Private Attributes

- static detail::cache< cl_platform_id, detail::opencl_platform > cache

  A cache to always return the same live platform for a given OpenCL platform.

9.10.2.17.1 Constructor & Destructor Documentation

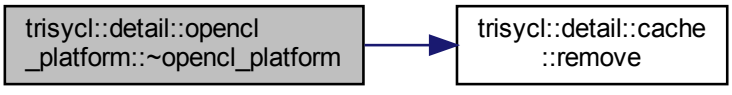
9.10.2.17.1.1 opencl_platform() `trisycl::detail::opencl_platform::opencl_platform ( const boost::compute::platform & p ) [inline], [private]`

Only the instance factory can built it.

Definition at line 107 of file opencl_platform.hpp.

```
00107 : p { p } {}
```

9.10.2.17.1.2 ~opencl_platform() `trisycl::detail::opencl_platform::~opencl_platform ( ) [inline], [override]`



Unregister from the cache on destruction.

Definition at line 112 of file opencl_platform.hpp.

```
00112                                {

9.10.2.17.2.7 is_host() bool trisycl::detail::opencl_platform::is_host ( ) const [inline], [override], [virtual]

Return false since an OpenCL platform is not the SYCL host platform.

Implements trisycl::detail::platform.

Definition at line 61 of file opencl_platform.hpp.

```
00061                                {
00062     return false;
00063   }
```

9.10.2.17.3 Member Data Documentation

9.10.2.17.3.1 cache detail::cache<cl_platform_id, detail::opencl_platform> trisycl::detail::opencl_platform::cache [static], [private]

A cache to always return the same live platform for a given OpenCL platform.

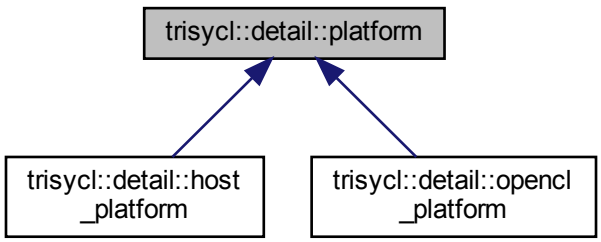
C++11 guaranties the static construction is thread-safe

Definition at line 44 of file opencl_platform.hpp.

9.10.2.17.3.2 p boost::compute::platform trisycl::detail::opencl_platform::p [private]

Use the Boost Compute abstraction of the OpenCL platform.

Definition at line 37 of file opencl_platform.hpp.



Referenced by get(), get_boost_compute(), get_extension_strings(), get_info_string(), has_extension(), and instance().

9.10.2.18 class trisycl::detail::platform

An abstract class representing various models of SYCL platforms.

Definition at line 28 of file platform.hpp.

Inheritance diagram for trisycl::detail::platform:

Public Member Functions

- virtual cl_platform_id get () const =0

  Return the cl_platform_id of the underlying OpenCL platform.
- virtual const boost::compute::platform & get_boost_compute () const =0

  Return the underlying Boost.Compute platform, if any.
- virtual bool is_host () const =0

  Return true if the platform is a SYCL host platform.
- virtual string_class get_info_string (info::platform param) const =0

  Query the platform for OpenCL string info::platform info.
- virtual vector_class< string_class > get_extension_strings () const =0
- virtual bool has_extension (const string_class &extension) const =0

  Specify whether a specific extension is supported on the platform.
- virtual vector_class< device > get_devices (const device_selector &device_selector) const =0

  Get all the available devices for this platform.
- virtual ~platform ()

9.10.2.18.1 Constructor & Destructor Documentation

9.10.2.18.1.1 ~platform() `virtual trisycl::detail::platform::~platform ( ) [inline], [virtual]`

Definition at line 64 of file platform.hpp.

```
00064 {}
```

9.10.2.18.2 Member Function Documentation

9.10.2.18.2.1 get() `virtual cl_platform_id trisycl::detail::platform::get ( ) const [pure virtual]`

Return the cl_platform_id of the underlying OpenCL platform.

Implemented in trisycl::detail::host_platform, and trisycl::detail::opencl_platform.

9.10.2.18.2.2 get_boost_compute() `virtual const boost::compute::platform & trisycl::detail::platform::get_boost_compute ( ) const [pure virtual]`

Return the underlying Boost.Compute platform, if any.

Implemented in trisycl::detail::host_platform, and trisycl::detail::opencl_platform.

9.10.2.18.2.3 get_devices() `virtual vector_class< device > trisycl::detail::platform::get_devices (`

```
        const device_selector & device_selector ) const [pure virtual]
```

Get all the available devices for this platform.

Parameters

in	*device_selector*	is used to filter the selection.

Returns

the device list

Implemented in trisycl::detail::host_platform, and trisycl::detail::opencl_platform.

9.10.2.18.2.4 get_extension_strings() `virtual vector_class< string_class > trisycl::detail::platform::get_extension_strings ( ) const [pure virtual]`

Implemented in trisycl::detail::opencl_platform, and trisycl::detail::host_platform.

9.10.2.18.2.5 get_info_string() `virtual string_class trisycl::detail::platform::get_info_string ( info::platform param ) const [pure virtual]`

Query the platform for OpenCL string info::platform info.

Implemented in trisycl::detail::host_platform, and trisycl::detail::opencl_platform.

9.10.2.18.2.6 has_extension() `virtual bool trisycl::detail::platform::has_extension ( const string_class & extension ) const [pure virtual]`

Specify whether a specific extension is supported on the platform.

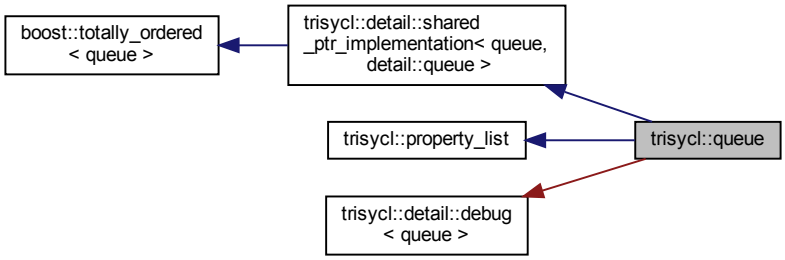
Implemented in trisycl::detail::host_platform, and trisycl::detail::opencl_platform.

9.10.2.18.2.7 is_host() `virtual bool trisycl::detail::platform::is_host ( ) const [pure virtual]`

Return true if the platform is a SYCL host platform.

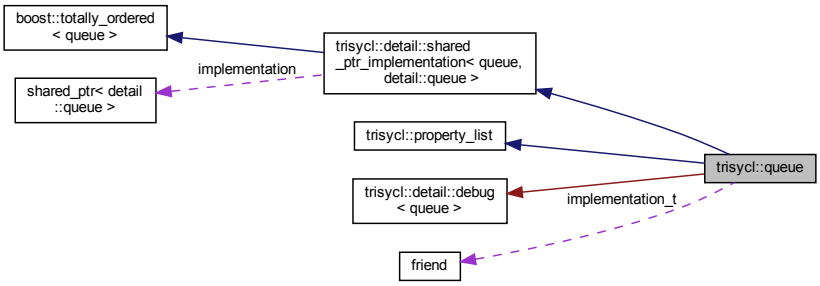
Implemented in trisycl::detail::host_platform, and trisycl::detail::opencl_platform.

9.10.2.19 class trisycl::queue



SYCL queue, similar to the OpenCL queue concept.

Todo The implementation is quite minimal for now. :-)



Todo All the queue methods should return a queue& instead of void to it is possible to chain opoerations

Definition at line 52 of file queue.hpp.

Inheritance diagram for trisycl::queue:

Collaboration diagram for trisycl::queue:

Public Member Functions

- queue (const property_list &propList={})

  Default constructor for queue from the default queue selector.
- queue (const async_handler &asyncHandler, const property_list &propList={})

  This constructor creates a SYCL queue from an OpenCL queue.
- queue (const device_selector &deviceSelector, const property_list &propList={})

  Creates a queue for the device provided by the device selector.

- queue (const device_selector &deviceSelector, const async_handler &asyncHandler, const property_list &propList={})

  Creates a queue for the device provided by the device selector.
- queue (const device &d, const async_handler &asyncHandler, const property_list &propList={})

  A queue is created for a SYCL device.
- queue (const device &d, const property_list &propList={})

  A queue is created for a SYCL device.
- queue (const context &syclContext, const device_selector &deviceSelector, const async_handler &async↩ Handler, const property_list &propList={})

  This constructor chooses a device based on the provided device_selector, which needs to be in the given context.
- queue (const context &syclContext, const device_selector &deviceSelector, const property_list &propList={})

  This constructor chooses a device based on the provided device_selector, which needs to be in the given context.
- queue (const cl_command_queue &q, const context &syclContext, const async_handler &ah={})

  This constructor creates a SYCL queue from an OpenCL queue.
- queue (const boost::compute::command_queue &q, async_handler ah=nullptr)

  Construct a queue instance using a boost::compute::command_queue.
- cl_command_queue get () const

  Return the underlying OpenCL command queue after doing a retain.
- boost::compute::command_queue get_boost_compute () const

  Return the underlying Boost.Compute command queue if it is an OpenCL queue.
- context get_context () const

  Return the SYCL queue's context.
- device get_device () const

  Return the SYCL device the queue is associated with.
- bool is_host () const

  Return whether the queue is executing on a SYCL host device.
- void wait ()

  Performs a blocking wait for the completion all enqueued tasks in the queue.
- void wait_and_throw ()

  Perform a blocking wait for the completion all enqueued tasks in the queue.
- void throw_asynchronous ()

  Checks to see if any asynchronous errors have been produced by the queue and if so reports them by passing them to the async_handler passed to the queue on construction.
- template<info::queue param>
  auto get_info () const

  Queries the platform for cl_command_queue info.
- template<typename Handler_Functor >
  event submit (Handler_Functor cgf)

  Submit a command group functor to the queue, in order to be scheduled for execution on the device.
- template<typename Handler_Functor >
  event submit (Handler_Functor cgf, queue &secondaryQueue)

  Submit a command group functor to the queue, in order to be scheduled for execution on the device.
- template<typename propertyT >
  bool has_property () const

  Check if the queue was constructed with the specified property.
- template<typename propertyT >
  propertyT get_property () const

  Return a copy of the property that the queue was constructed with.

Private Types

9.10.2.19.2 Constructor & Destructor Documentation

9.10.2.19.2.1 queue() [1/10] `trisycl::queue::queue (`
`const property_list & propList = {} ) [explicit]`

Default constructor for queue from the default queue selector.

Returns errors via the SYCL exception class.

9.10.2.19.2.2 queue() [2/10] `trisycl::queue::queue (`
`const async_handler & asyncHandler,`
`const property_list & propList = {} )`

This constructor creates a SYCL queue from an OpenCL queue.

At construction it does a retain on the queue memory object.

Retain a reference to the cl_command_queue object. Caller should release the passed cl_command_queue object when it is no longer needed.

Return synchronous errors regarding the creation of the queue and report asynchronous errors via the async_↩ handler callback function in conjunction with the synchronization and throw methods.

Note that the default case asyncHandler = nullptr is handled by the default constructor.

9.10.2.19.2.3 queue() [3/10] `trisycl::queue::queue (`
`const device_selector & deviceSelector,`
`const property_list & propList = {} ) [inline]`

Creates a queue for the device provided by the device selector.

If no device is selected, an error is reported.

Return synchronous errors regarding the creation of the queue and report asynchronous errors via the `async_↩ handler` callback function if and only if there is an `async_handler` provided.

Definition at line 106 of file queue.hpp.

```
00107                                       {})
00108     // Just create the queue from the selected device
00109     :  queue { device { deviceSelector }, nullptr, propList } { }
```

9.10.2.19.2.4 queue() [4/10] trisycl::queue::queue (

```
const device_selector & deviceSelector,
const async_handler & asyncHandler,
const property_list & propList = {} )  [inline]
```

Creates a queue for the device provided by the device selector.

Return synchronous errors regarding the creation of the queue and report asynchronous errors via the `async_handler` callback function if and only if there is an `async_handler` provided.

Definition at line 117 of file queue.hpp.

```
00119                                       {})
00120     // Just create the queue from the selected device
00121     :  queue { device { deviceSelector }, asyncHandler, propList } { }
```

9.10.2.19.2.5 queue() [5/10] trisycl::queue::queue (

```
const device & d,
const async_handler & asyncHandler,
const property_list & propList = {} )  [inline]
```

A queue is created for a SYCL device.

Return asynchronous errors via the `async_handler` callback function.

Definition at line 128 of file queue.hpp.

```
00130                                       {}) :  implementation_t {
00131 #ifdef TRISYCL_OPENCL
00132     d.is_host()
00133       ?  std::shared_ptr<detail::queue>{ new detail::host_queue }
00134       :  detail::opencl_queue::instance(d)

00136     new detail::host_queue
00137 #endif
00138   }, property_list { propList } { }
```

9.10.2.19.2.6 queue() [6/10] trisycl::queue::queue (

```
const device & d,
const property_list & propList = {} )  [inline]
```

A queue is created for a SYCL device.

Definition at line 143 of file queue.hpp.

```
00144                                       {})
00145     :  queue { d, {}, propList } {}
```

9.10.2.19.2.7 queue() [7/10] trisycl::queue::queue (

```
const context & syclContext,
const device_selector & deviceSelector,
const async_handler & asyncHandler,
const property_list & propList = {} )  [inline]
```

This constructor chooses a device based on the provided device_selector, which needs to be in the given context.

If no device is selected, an error is reported.

Return synchronous errors regarding the creation of the queue.

If and only if there is an asyncHandler provided, it reports asynchronous errors via the async_handler callback function in conjunction with the synchronization and throw methods.

Definition at line 158 of file queue.hpp.

```
00161                                  {})
00162     :  property_list { propList } {
00163     device d = deviceSelector.select_device();

00165     if (std::find(ctx_devs.begin(), ctx_devs.end(), d) == ctx_devs.end())
00166       throw trisycl::invalid_object_error("Device doesn't belong to context\n");
00167     implementation =
00168 #ifdef TRISYCL_OPENCL
00169       d.is_host() ?  std::shared_ptr<detail::queue>{ new detail::host_queue }
00170     :  detail::opencl_queue::instance(d);
00171 #else
00172     std::shared_ptr<detail::queue>{ new detail::host_queue };
00173 #endif
00174   }
```

9.10.2.19.2.8 queue() [8/10] trisycl::queue::queue (

```
const context & syclContext,
const device_selector & deviceSelector,
const property_list & propList = {} )  [inline]
```

This constructor chooses a device based on the provided device_selector, which needs to be in the given context.

If no device is selected, an error is reported.

Return synchronous errors regarding the creation of the queue.

Definition at line 183 of file queue.hpp.

```
00185                                  {})
00186     :  queue { syclContext, deviceSelector, {}, propList } {}
```

9.10.2.19.2.9 queue() [9/10] trisycl::queue::queue (

```
const cl_command_queue & q,
const context & syclContext,
const async_handler & ah = {} )  [inline]
```

This constructor creates a SYCL queue from an OpenCL queue.

At construction it does a retain on the queue memory object.

Return synchronous errors regarding the creation of the queue. If and only if there is an async_handler provided, it reports asynchronous errors via the async_handler callback function in conjunction with the synchronization and throw methods.

Definition at line 198 of file queue.hpp.

```
00199                               {})
00200     :  queue { boost::compute::command_queue { q }, ah } {}
```

9.10.2.19.2.10 queue() [10/10] trisycl::queue::queue (const boost::compute::command_queue & q, async_handler ah = nullptr) [inline]

Construct a queue instance using a boost::compute::command_queue.

This is a triSYCL extension for boost::compute interoperation.

Return synchronous errors via the SYCL exception class.

Todo Deal with handler

Definition at line 211 of file queue.hpp.

```
00212     :  implementation_t { detail::opencl_queue::instance(q) }, property_list {} {}
```

9.10.2.19.3 Member Function Documentation

9.10.2.19.3.1 get() cl_command_queue trisycl::queue::get ( ) const [inline]

Return the underlying OpenCL command queue after doing a retain.

This memory object is expected to be released by the developer.

Retain a reference to the returned cl_command_queue object.

Caller should release it when finished.

If the queue is a SYCL host queue then an exception is thrown.

Definition at line 227 of file queue.hpp.

```
00227                                {
00228     return implementation->get();
00229   }
```

References trisycl::detail::shared_ptr_implementation< queue, detail::queue >::implementation.

9.10.2.19.3.2 get_boost_compute() boost::compute::command_queue trisycl::queue::get_boost_↩ compute ( ) const [inline]

Return the underlying Boost.Compute command queue if it is an OpenCL queue.

This is a triSYCL extension

Definition at line 237 of file queue.hpp.

```
00237                                                {
00238     return implementation->get_boost_compute();
00239   }
```

References trisycl::detail::shared_ptr_implementation< queue, detail::queue >::implementation.

9.10.2.19.3.3 get_context() context trisycl::queue::get_context ( ) const [inline]

Return the SYCL queue's context.

Report errors using SYCL exception classes.

Definition at line 247 of file queue.hpp.

```
00247                                {
00248     return implementation->get_context();
00249   }
```

References trisycl::detail::shared_ptr_implementation< queue, detail::queue >::implementation.

9.10.2.19.3.4 get_device() device trisycl::queue::get_device ( ) const [inline]

Return the SYCL device the queue is associated with.

Report errors using SYCL exception classes.

Definition at line 256 of file queue.hpp.

```
00256                               {
00257     return implementation->get_device();
00258   }
```

References trisycl::detail::shared_ptr_implementation< queue, detail::queue >::implementation.

9.10.2.19.3.5 get_info() template<info::queue param> auto trisycl::queue::get_info ( ) const [inline]

Queries the platform for cl_command_queue info.

9.10.2.19.3.6 get_property() template<typename propertyT > propertyT trisycl::queue::get_property ( ) const [inline]

Return a copy of the property that the queue was constructed with.

Definition at line 355 of file queue.hpp.

```
00355                                    {
00356     return property_list::get_property<propertyT>();
00357   }
```

9.10.2.19.3.7 has_property() template<typename propertyT > bool trisycl::queue::has_property ( ) const [inline]

Check if the queue was constructed with the specified property.

Definition at line 347 of file queue.hpp.

```
00347                                   {
00348     return property_list::has_property<propertyT>();
00349   }
```

9.10.2.19.3.8 is_host() `bool trisycl::queue::is_host ( ) const [inline]`

Return whether the queue is executing on a SYCL host device.

Definition at line 262 of file queue.hpp.

```
00262                          {
00263     return implementation->is_host();
00264   }
```

References trisycl::detail::shared_ptr_implementation< queue, detail::queue >::implementation.

9.10.2.19.3.9 submit() [1/2] `template<typename Handler_Functor >`

```
event trisycl::queue::submit (
             Handler_Functor cgf ) [inline]
```

Submit a command group functor to the queue, in order to be scheduled for execution on the device.

Use an explicit functor parameter taking a handler& so we can use "auto" in submit() lambda parameter.

Todo Add in the spec an implicit conversion of event to queue& so it is possible to chain operations on the queue

Definition at line 320 of file queue.hpp.

```
00320                                  {
00321     handler command_group_handler { implementation };
00322     cgf(command_group_handler);
00323     return {};
00324   }
```

References trisycl::detail::shared_ptr_implementation< queue, detail::queue >::implementation.

Referenced by submit().

Here is the caller graph for this function:

9.10.2.19.3.10 submit() [2/2] template<typename Handler_Functor >

```
event trisycl::queue::submit (
            Handler_Functor cgf,
            queue & secondaryQueue )  [inline]
```

Submit a command group functor to the queue, in order to be scheduled for execution on the device.

On kernel error, this command group functor, then it is scheduled for execution on the secondary queue.

Return a command group functor event, which is corresponds to the queue the command group functor is being enqueued on.

Definition at line 337 of file queue.hpp.

```
00337                                                    {
00338     TRISYCL_UNIMPL;
00339     // Since it is not implemented, always submit on the main queue
00340     return submit(cgf);
00341   }
```

References submit(), and TRISYCL_UNIMPL.

Here is the call graph for this function:

9.10.2.19.3.11 throw_asynchronous() void trisycl::queue::throw_asynchronous ( ) [inline]

Checks to see if any asynchronous errors have been produced by the queue and if so reports them by passing them to the async_handler passed to the queue on construction.

If no async_handler was provided then asynchronous exceptions will be lost.

Definition at line 301 of file queue.hpp.

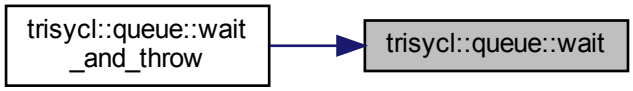
```
00301                                {
00302     TRISYCL_UNIMPL;
00303   }
```

References TRISYCL_UNIMPL.

9.10.2.19.3.12 wait() `void trisycl::queue::wait ( ) [inline]`

Performs a blocking wait for the completion all enqueued tasks in the queue.

Synchronous errors will be reported through SYCL exceptions.



Definition at line 272 of file queue.hpp.

```
00272             {
00273     implementation->wait_for_kernel_execution();
00274   }
```

References trisycl::detail::shared_ptr_implementation< queue, detail::queue >::implementation.

Referenced by wait_and_throw().

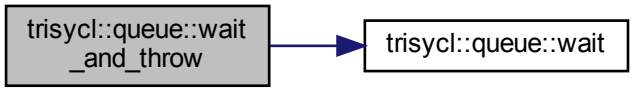
Here is the caller graph for this function:

9.10.2.19.3.13 wait_and_throw() `void trisycl::queue::wait_and_throw ( ) [inline]`

Perform a blocking wait for the completion all enqueued tasks in the queue.

Synchronous errors will be reported via SYCL exceptions.

Asynchronous errors will be passed to the async_handler passed to the queue on construction.



If no async_handler was provided then asynchronous exceptions will be lost.

Definition at line 287 of file queue.hpp.

```
00287                       {
00288     // \todo Implement the throw part of wait_and_throw
00289     wait();
00290     TRISYCL_UNIMPL;
00291   }
```

References TRISYCL_UNIMPL, and wait().

Here is the call graph for this function:

9.10.2.19.4 Member Data Documentation

9.10.2.19.4.1 implementation_t `friend trisycl::queue::implementation_t [private]`

Definition at line 67 of file queue.hpp.

9.10.3 Macro Definition Documentation

9.10.3.1 PLATFORM_GET_INFO_STRING

```
#define PLATFORM_GET_INFO_STRING(
              X )
```

`#include <include/triSYCL/platform.hpp>`

Value:

```
template<>                              \
inline auto platform::get_info<info::platform::X>()const { \
  return implementation->get_info_string(info::platform::X);    \
}
```

Definition at line 166 of file platform.hpp.

9.10.4 Typedef Documentation

9.10.4.1 cpu_selector

```
using trisycl::cpu_selector = typedef device_typename_selector<info::device_type::cpu>
```

`#include <include/triSYCL/device_selector/detail/device_selector_tail.hpp>`

Select devices according to device type info::device::device_type::cpu from all the available devices and heuristics.

If no OpenCL CPU device is found the selector fails.

Definition at line 155 of file device_selector_tail.hpp.

9.10.4.2 default_selector

```
using trisycl::default_selector = typedef device_typename_selector<info::device_type::automatic>
```

```
#include <include/triSYCL/device_selector/detail/device_selector_tail.hpp>
```

Devices selected by heuristics of the system.

If no OpenCL device is found then it defaults to the SYCL host device.

To influence the default device selection, use the Boost.Compute environment variables:

- BOOST_COMPUTE_DEFAULT_DEVICE
- BOOST_COMPUTE_DEFAULT_DEVICE_TYPE
- BOOST_COMPUTE_DEFAULT_PLATFORM
- BOOST_COMPUTE_DEFAULT_VENDOR

Definition at line 137 of file device_selector_tail.hpp.

9.10.4.3 device_exec_capabilities

```
using trisycl::info::device_exec_capabilities = typedef unsigned int
```

```
#include <include/triSYCL/info/device.hpp>
```

Definition at line 180 of file device.hpp.

9.10.4.4 device_fp_config

```
using trisycl::info::device_fp_config = typedef unsigned int
```

```
#include <include/triSYCL/info/device.hpp>
```

Definition at line 179 of file device.hpp.

9.10.4.5 device_queue_properties

```
using trisycl::info::device_queue_properties = typedef unsigned int
```

```
#include <include/triSYCL/info/device.hpp>
```

Definition at line 181 of file device.hpp.

9.10.4.6 gpu_selector

```
using trisycl::gpu_selector = typedef device_typename_selector<info::device_type::gpu>
```

```
#include <include/triSYCL/device_selector/detail/device_selector_tail.hpp>
```

Select devices according to device type info::device::device_type::gpu from all the available OpenCL devices.

If no OpenCL GPU device is found the selector fails.

Select the best GPU, if any.

Definition at line 147 of file device_selector_tail.hpp.

9.10.4.7 host_selector

```
using trisycl::host_selector = typedef device_typename_selector<info::device_type::host>
```

```
#include <include/triSYCL/device_selector/detail/device_selector_tail.hpp>
```

Selects the SYCL host CPU device that does not require an OpenCL runtime.

Definition at line 161 of file device_selector_tail.hpp.

9.10.5 Enumeration Type Documentation

9.10.5.1 context

```
enum class trisycl::info::context :  int  [strong]
```

```
#include <include/triSYCL/info/context.hpp>
```

Context information descriptors.

Todo Should be unsigned int to be consistent with others?

Enumerator

reference_count	
platform	
devices	

Definition at line 25 of file context.hpp.

```
00025                   :  int {
```

```
00026   reference_count,
00027   platform,
00028   devices
00029 };
```

9.10.5.2 device

```
enum class trisycl::info::device :  int  [strong]
```

```
#include <include/triSYCL/info/device.hpp>
```

Device information descriptors.

From specs/latex/headers/deviceInfo.h in the specification

00138 };
```

9.10.5.10 platform

```
enum class trisycl::info::platform : unsigned int [strong]
```

```
#include <include/triSYCL/info/platform.hpp>
```

Platform information descriptors.

A SYCL platform can be queried for all of the following information using the get_info function.

In this implementation, the values are mapped to OpenCL values to avoid further remapping later when OpenCL is used

Enumerator

TRISYCL_OPENCL_ONLY	Returns the profile name (as a string_class) supported by the implementation. Can be either FULL PROFILE or EMBEDDED PROFILE.
TRISYCL_OPENCL_ONLY	Returns the OpenCL software driver version string in the form major number.minor number (as a string_class)
TRISYCL_OPENCL_ONLY	Returns the name of the platform (as a string_class)
TRISYCL_OPENCL_ONLY	Returns the string provided by the platform vendor (as a string_class)
TRISYCL_OPENCL_ONLY	Returns a space-separated list of extension names supported by the platform (as a string_class)

Definition at line 30 of file platform.hpp.

```
00030                        : unsigned int {
00031 /** Returns the profile name (as a string_class) supported by the
00032 implementation.
00033
00034 Can be either FULL PROFILE or EMBEDDED PROFILE.

```
template<>
auto trisycl::context::get_info< info::context::reference_count > ( ) const  [inline]
```

#include <include/triSYCL/context.hpp>

Definition at line 213 of file context.hpp.

```
00213                                                           {
00214   return implementation->get_reference_count();
00215 }
```

9.10.6.4 get_devices() [1/2]

```
vector_class<::trisycl::device > trisycl::detail::host_platform::get_devices (
            const device_selector & device_selector ) const  [inline], [override], [virtual]
```

#include <include/triSYCL/platform/detail/host_platform.hpp>

Get all the available devices for the host platform.

Get all the available devices for this platform.

Parameters

in	*device_type*	is the device type to filter the selection or `info::device_type::all` by default to return all the devices

Returns

the device list

If `get_devices` is called with the host platform and the right device type, returns the host_device.

Implements trisycl::detail::platform.

Definition at line 29 of file host_platform_tail.hpp.

```
00029                                                                          {
00030 /** If \c get_devices is called with the host platform
00031 and the right device type, returns the host_device.
00032 */
00033   if (device_selector(::trisycl::device {}) > 0)
00034     // Return 1 default device, i.e.  the host device
00035     return { {} };
00036   else
00037     // No matching device
00038     return {};
00039 }
```

9.10.6.5 get_devices() [2/2]

```
vector_class<::trisycl::device > trisycl::detail::opencl_platform::get_devices (
            const device_selector & device_selector ) const  [inline], [override], [virtual]
```

`#include <include/triSYCL/platform/detail/opencl_platform.hpp>`

Get all the available devices for this OpenCL platform.

Returns a vector class containing all SYCL devices associated with this OpenCL platform.

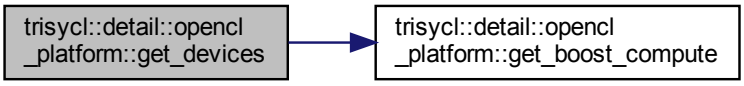
Parameters

in	*device_type*	is the device type to filter the selection or `info::device_type::all` by default to return all the devices

Returns

the device list

Implements trisycl::detail::platform.



Definition at line 30 of file opencl_platform_tail.hpp.

```
00030                                                                          {

9.11 Dealing with OpenCL address spaces

Collaboration diagram for Dealing with OpenCL address spaces:

Namespaces

- namespace trisycl::access

  Describe the type of access by kernels.

Classes

- struct trisycl::detail::ocl_type< T, AS >

  Generate a type with some real OpenCL 2 attribute if we are on an OpenCL device. More...
- struct trisycl::detail::ocl_type< T, access::address_space::constant_space >

  Add an attribute for __constant address space. More...
- struct trisycl::detail::ocl_type< T, access::address_space::global_space >

  Add an attribute for __global address space. More...
- struct trisycl::detail::ocl_type< T, access::address_space::local_space >

  Add an attribute for __local address space. More...
- struct trisycl::detail::ocl_type< T, access::address_space::private_space >

  Add an attribute for __private address space. More...
- struct trisycl::detail::address_space_array< T, AS >

  Implementation of an array variable with an OpenCL address space. More...
- struct trisycl::detail::address_space_fundamental< T, AS >

  Implementation of a fundamental type with an OpenCL address space. More...
- struct trisycl::detail::address_space_object< T, AS >

  Implementation of an object type with an OpenCL address space. More...
- struct trisycl::detail::address_space_ptr< T, AS >

  Implementation for an OpenCL address space pointer. More...
- struct trisycl::detail::address_space_base< T, AS >

  Implementation of the base infrastructure to wrap something in an OpenCL address space. More...
- struct trisycl::detail::address_space_variable< T, AS >

  Implementation of a variable with an OpenCL address space. More...

Typedefs

- template<typename T >
  using trisycl::constant = detail::addr_space< T, access::address_space::constant_space >

  Declare a variable to be in the OpenCL constant address space.
- template<typename T >
  using trisycl::constant_ptr = constant< T * >

  Declare a variable to be in the OpenCL constant address space.
- template<typename T >
  using trisycl::generic = detail::addr_space< T, access::address_space::generic_space >

  Declare a variable to be in the OpenCL 2 generic address space.
- template<typename T >
  using trisycl::global = detail::addr_space< T, access::address_space::global_space >

  Declare a variable to be in the OpenCL global address space.
- template<typename T >
  using trisycl::global_ptr = global< T * >

  Declare a variable to be in the OpenCL global address space.
- template<typename T >
  using trisycl::local = detail::addr_space< T, access::address_space::local_space >

  Declare a variable to be in the OpenCL local address space.
- template<typename T >
  using trisycl::local_ptr = local< T * >

  Declare a variable to be in the OpenCL local address space.
- template<typename T >
  using trisycl::priv = detail::addr_space< T, access::address_space::private_space >

  Declare a variable to be in the OpenCL private address space.
- template<typename T >
  using trisycl::private_ptr = priv< T * >

  Declare a variable to be in the OpenCL private address space.
- template<typename Pointer , access::address_space AS>
  using trisycl::multi_ptr = detail::address_space_ptr< Pointer, AS >

  A pointer that can be statically associated to any address-space.
- template<typename T , access::address_space AS>
  using trisycl::detail::addr_space = typename std::conditional< std::is_pointer< T >::value, address_space_ptr< T, AS >, typename std::conditional< std::is_class< T >::value, address_space_object< T, AS >, typename std::conditional< std::is_array< T >::value, address_space_array< T, AS >, address_space_fundamental< T, AS > >::type >::type >::type

  Dispatch the address space implementation according to the requested type.

Functions

- template<typename T , access::address_space AS>
  multi_ptr< T, AS > trisycl::make_ptr (multi_ptr< T, AS > pointer)

  Construct a trisycl::multi_ptr<> with the right type.
- template<typename T , access::address_space AS>
  multi_ptr< T, AS > trisycl::make_ptr (T *pointer)

  Construct a trisycl::multi_ptr<> with the right type.

9.11.1 Detailed Description

9.11.2 Class Documentation

9.11.2.1 struct trisycl::detail::ocl_type

template<typename T, access::address_space AS>
struct trisycl::detail::ocl_type< T, AS >

Generate a type with some real OpenCL 2 attribute if we are on an OpenCL device.

In the general case, do not add any OpenCL address space qualifier

Definition at line 63 of file address_space.hpp.

Public Types

- using type = T

9.11.2.1.1 Member Typedef Documentation

9.11.2.1.1.1 type template<typename T , access::address_space AS>

```
using trisycl::detail::ocl_type< T, AS >::type = T
```

Definition at line 64 of file address_space.hpp.

9.11.2.2 struct trisycl::detail::ocl_type< T, access::address_space::constant_space >

template<typename T>
struct trisycl::detail::ocl_type< T, access::address_space::constant_space >

Add an attribute for __constant address space.

Definition at line 69 of file address_space.hpp.

Public Types

- using type = TRISYCL_CONSTANT_AS T

9.11.2.2.1 Member Typedef Documentation

9.11.2.2.1.1 type template<typename T >

```
using trisycl::detail::ocl_type< T, access::address_space::constant_space >::type = TRISYCL_CONSTANT_AS
T
```

Definition at line 70 of file address_space.hpp.

9.11.2.3 struct trisycl::detail::ocl_type< T, access::address_space::global_space >

template<typename T>
struct trisycl::detail::ocl_type< T, access::address_space::global_space >

Add an attribute for __global address space.

Definition at line 83 of file address_space.hpp.

Public Types

- using type = TRISYCL_GLOBAL_AS T

9.11.2.3.1 Member Typedef Documentation

9.11.2.3.1.1 type template<typename T >

```
using trisycl::detail::ocl_type< T, access::address_space::global_space >::type = TRISYCL_GLOBAL_AS
T
```

Definition at line 84 of file address_space.hpp.

9.11.2.4 struct trisycl::detail::ocl_type< T, access::address_space::local_space >

template<typename T>
struct trisycl::detail::ocl_type< T, access::address_space::local_space >

Add an attribute for __local address space.

Definition at line 89 of file address_space.hpp.

Public Types

- using type = TRISYCL_LOCAL_AS T

9.11.2.4.1 Member Typedef Documentation

9.11.2.4.1.1 type template<typename T >

```
using trisycl::detail::ocl_type< T, access::address_space::local_space >::type = TRISYCL_LOCAL_AS
T
```

Definition at line 90 of file address_space.hpp.

9.11.2.5 struct trisycl::detail::ocl_type< T, access::address_space::private_space >

template<typename T>
struct trisycl::detail::ocl_type< T, access::address_space::private_space >

Add an attribute for __private address space.

Definition at line 95 of file address_space.hpp.

Public Types

- using type = TRISYCL_PRIVATE_AS T

9.11.2.5.1 Member Typedef Documentation

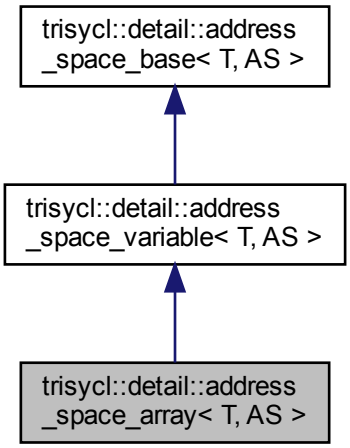
9.11.2.5.1.1 type template<typename T >

```
using trisycl::detail::ocl_type< T, access::address_space::private_space >::type = TRISYCL_PRIVATE_AS
T
```

Definition at line 96 of file address_space.hpp.

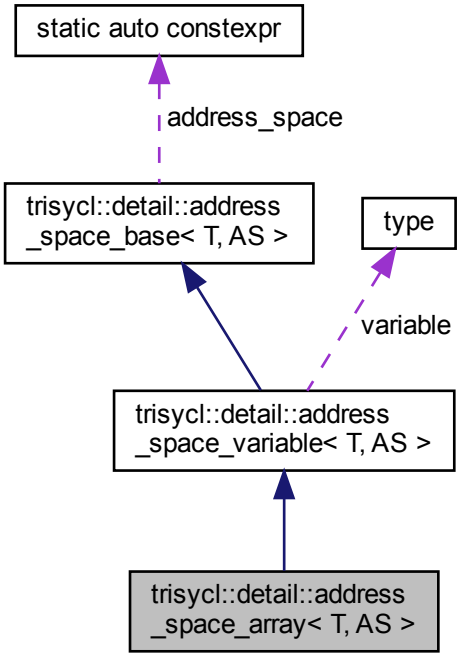
9.11.2.6 struct trisycl::detail::address_space_array

template<typename T, access::address_space AS>
struct trisycl::detail::address_space_array< T, AS >



Implementation of an array variable with an OpenCL address space.

Parameters



T	is the type of the basic object to be created
AS	is the address space to place the object into

Definition at line 317 of file address_space.hpp.

Inheritance diagram for trisycl::detail::address_space_array< T, AS >:

Collaboration diagram for trisycl::detail::address_space_array< T, AS >:

Public Types

- using super = address_space_variable< T, AS >

Keep track of the base class as a short-cut.

Public Member Functions

- address_space_array (const T &array)
  Allow to create an address space array from an array.
- address_space_array (std::initializer_list< std::remove_extent_t< T > > list)
  Allow to create an address space array from an initializer list.

Additional Inherited Members

9.11.2.6.1 Member Typedef Documentation

9.11.2.6.1.1 super `template<typename T , access::address_space AS>`

```
using trisycl::detail::address_space_array< T, AS >::super = address_space_variable<T, AS>
```

Keep track of the base class as a short-cut.

Definition at line 319 of file address_space.hpp.

9.11.2.6.2 Constructor & Destructor Documentation

9.11.2.6.2.1 address_space_array() [1/2] `template<typename T , access::address_space AS>`

```
trisycl::detail::address_space_array< T, AS >::address_space_array (
            const T & array ) [inline]
```

Allow to create an address space array from an array.

Definition at line 327 of file address_space.hpp.

```
00327                                       {
00328     std::copy(std::begin(array), std::end(array), std::begin(super::variable));
00329   };
```

References trisycl::detail::address_space_variable< T, AS >::variable.

9.11.2.6.2.2 address_space_array() [2/2] `template<typename T , access::address_space AS>`

```
trisycl::detail::address_space_array< T, AS >::address_space_array (
            std::initializer_list< std::remove_extent_t< T > > list ) [inline]
```

Allow to create an address space array from an initializer list.

Todo Extend to more than 1 dimension

Definition at line 336 of file address_space.hpp.

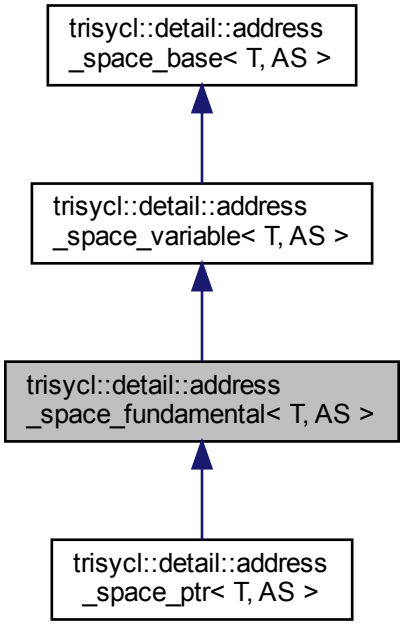
```
00336                                                                       {
00337     std::copy(std::begin(list), std::end(list), std::begin(super::variable));
00338   };
```

References trisycl::detail::address_space_variable< T, AS >::variable.

9.11.2.7 struct trisycl::detail::address_space_fundamental

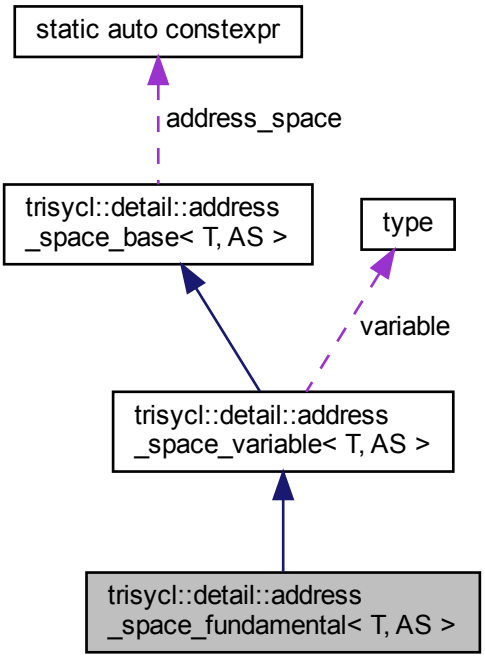
template<typename T, access::address_space AS>
struct trisycl::detail::address_space_fundamental< T, AS >

Implementation of a fundamental type with an OpenCL address space.



Parameters

T	is the type of the basic object to be created
AS	is the address space to place the object into



Todo Verify/improve to deal with const/volatile?

Definition at line 225 of file address_space.hpp.

Inheritance diagram for trisycl::detail::address_space_fundamental< T, AS >:

Collaboration diagram for trisycl::detail::address_space_fundamental< T, AS >:

Public Types

- using super = address_space_variable< T, AS >

  Keep track of the base class as a short-cut.

Public Member Functions

- address_space_fundamental ()=default

  Also request for the default constructors that have been disabled by the declaration of another constructor.
- template<typename SomeType , trisycl::access::address_space SomeAS>
  address_space_fundamental (address_space_fundamental< SomeType, SomeAS > &v)

  Allow for example assignment of a global<float> to a priv<double> for example.

Additional Inherited Members

9.11.2.7.1 Member Typedef Documentation

9.11.2.7.1.1 super `template<typename T , access::address_space AS>`

```
using trisycl::detail::address_space_fundamental< T, AS >::super = address_space_variable<T,
AS>
```

Keep track of the base class as a short-cut.

Definition at line 227 of file address_space.hpp.

9.11.2.7.2 Constructor & Destructor Documentation

9.11.2.7.2.1 address_space_fundamental() [1/2] template<typename T , access::address_space AS> trisycl::detail::address_space_fundamental< T, AS >::address_space_fundamental ( ) [default]

Also request for the default constructors that have been disabled by the declaration of another constructor.

This ensures for example that we can write
```
generic<float *> q;
```

without initialization.

9.11.2.7.2.2 address_space_fundamental() [2/2] template<typename T , access::address_space AS> template<typename SomeType , trisycl::access::address_space SomeAS> trisycl::detail::address_space_fundamental< T, AS >::address_space_fundamental (address_space_fundamental< SomeType, SomeAS > & v) [inline]

Allow for example assignment of a global<float> to a priv<double> for example.

Since it needs 2 implicit conversions, it does not work with the conversion operators already define, so add 1 more explicit conversion here so that the remaining implicit conversion can be found by the compiler.

Strangely
```
template <typename SomeType, address_space SomeAS>
address_space_base(addr_space<SomeType, SomeAS>& v)
:  variable(SomeType(v)) { }
```

cannot be used here because SomeType cannot be inferred. So use address_space_base<> instead

Need to think further about it...

Definition at line 265 of file address_space.hpp.
```
00266   {
00267     /* Strangely I cannot have it working in the initializer instead, for
00268 some cases */
00269     super::variable = SomeType(v);
00270   }
```

References trisycl::detail::address_space_variable< T, AS >::variable.

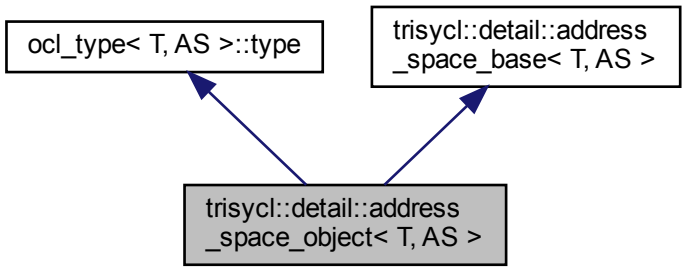
9.11.2.8 struct trisycl::detail::address_space_object

template<typename T, access::address_space AS>
struct trisycl::detail::address_space_object< T, AS >

Implementation of an object type with an OpenCL address space.

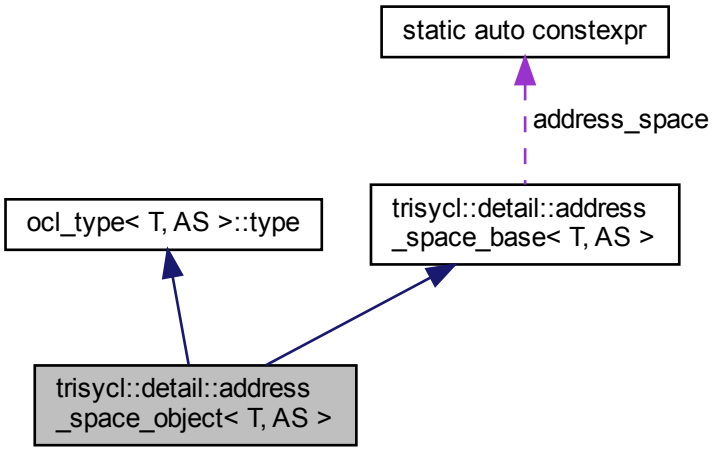
Parameters

T	is the type of the basic object to be created
AS	is the address space to place the object into



The class implementation is just inheriting of T so that all methods and non-member operators on T work also on address_space_object<T>

Todo Verify/improve to deal with const/volatile?



Todo what about T having some final methods?

Definition at line 358 of file address_space.hpp.

Inheritance diagram for trisycl::detail::address_space_object< T, AS >:

Collaboration diagram for trisycl::detail::address_space_object< T, AS >:

Public Types

- using opencl_type = typename ocl_type< T, AS >::type

  Store the base type of the object with OpenCL address space modifier.

Public Member Functions

- address_space_object (T &&v)

  Allow to create an address space version of an object or to convert one.
- operator opencl_type & ()

  Conversion operator to allow a address_space_object<T> to be used as a T so that all the methods of a T and the built-in operators for T can be used on a address_space_object<T> too.

Additional Inherited Members

9.11.2.8.1 Member Typedef Documentation

9.11.2.8.1.1 opencl_type `template<typename T , access::address_space AS>`

```
using trisycl::detail::address_space_object< T, AS >::opencl_type = typename ocl_type<T,
AS>::type
```

Store the base type of the object with OpenCL address space modifier.

Todo Add to the specification

Definition at line 364 of file address_space.hpp.

9.11.2.8.2 Constructor & Destructor Documentation

9.11.2.8.2.1 address_space_object() `template<typename T , access::address_space AS>`

```
trisycl::detail::address_space_object< T, AS >::address_space_object (
            T && v )  [inline]
```

Allow to create an address space version of an object or to convert one.

Definition at line 375 of file address_space.hpp.

```
00375 :  opencl_type(v) { }
```

9.11.2.8.3 Member Function Documentation

9.11.2.8.3.1 operator opencl_type &() `template<typename T , access::address_space AS>`

```
trisycl::detail::address_space_object< T, AS >::operator opencl_type & ( )  [inline]
```

Conversion operator to allow a address_space_object<T> to be used as a T so that all the methods of a T and the built-in operators for T can be used on a address_space_object<T> too.

Use opencl_type so that if we take the address of it, the address space is kept.

Definition at line 383 of file address_space.hpp.

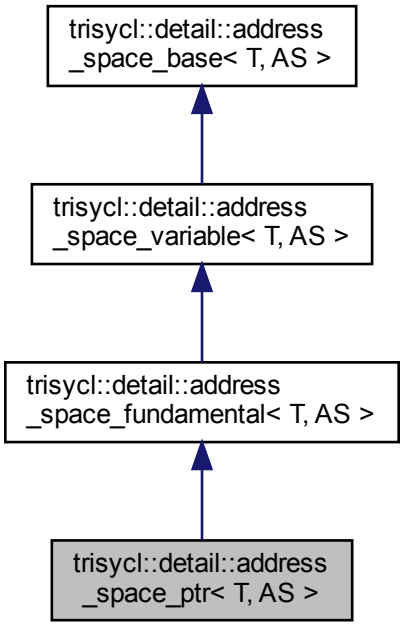
```
00383 { return *this; }
```

9.11.2.9 struct trisycl::detail::address_space_ptr

template<typename T, access::address_space AS>
struct trisycl::detail::address_space_ptr< T, AS >

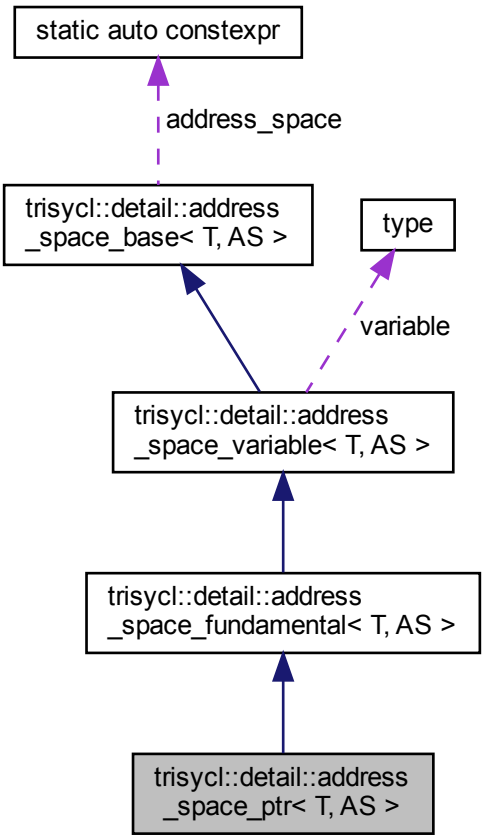
Implementation for an OpenCL address space pointer.

Parameters



T	is the pointer type

Note that if *T* is not a pointer type, it is an error.



All the address space pointers inherit from it, which makes trivial the implementation of `trisycl::multi_ptr<T, AS>`

Definition at line 285 of file address_space.hpp.

Inheritance diagram for trisycl::detail::address_space_ptr< T, AS >:

Collaboration diagram for trisycl::detail::address_space_ptr< T, AS >:

Public Types

- using super = address_space_fundamental< T, AS >

  Keep track of the base class as a short-cut.
- using pointer_t = typename super::address_space_fundamental::type
- using reference_t = typename std::remove_pointer_t< pointer_t > &

Public Member Functions

- address_space_ptr (address_space_fundamental< typename std::pointer_traits< T >::element_type, AS > *p)

  Allow initialization of a pointer type from the address of an element with the same type and address space.
- address_space_ptr ()=default

  Put back the default constructors canceled by the previous definition.

Additional Inherited Members

            address_space_fundamental< typename std::pointer_traits< T >::element_type, AS >
* p )  [inline]
```

Allow initialization of a pointer type from the address of an element with the same type and address space.

Definition at line 302 of file address_space.hpp.

```
00303     :  address_space_fundamental<T, AS> { p->get_address() } {}
```

References p.

9.11.2.9.2.2 address_space_ptr() [2/2] template<typename T , access::address_space AS>

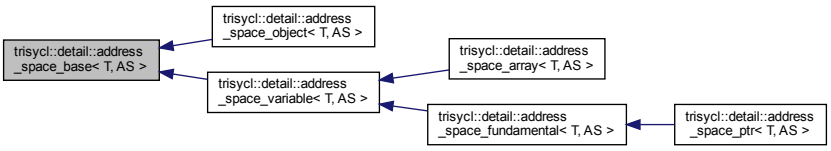
```
trisycl::detail::address_space_ptr< T, AS >::address_space_ptr ( )  [default]
```

Put back the default constructors canceled by the previous definition.

9.11.2.10 struct trisycl::detail::address_space_base

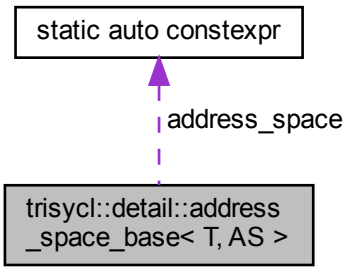
template<typename T, access::address_space AS>
struct trisycl::detail::address_space_base< T, AS >

Implementation of the base infrastructure to wrap something in an OpenCL address space.



Parameters

T	is the type of the basic stuff to be created
AS	is the address space to place the object into



Todo Verify/improve to deal with const/volatile?

Definition at line 143 of file address_space.hpp.

Inheritance diagram for trisycl::detail::address_space_base< T, AS >:

Collaboration diagram for trisycl::detail::address_space_base< T, AS >:

Public Types

- using type = T

  Store the base type of the object.
- using opencl_type = typename ocl_type< T, AS >::type

  Store the base type of the object with OpenCL address space modifier.

Static Public Attributes

- static auto constexpr address_space = AS

  Set the address_space identifier that can be queried to know the pointer type.

9.11.2.10.1 Member Typedef Documentation

9.11.2.10.1.1 opencl_type `template<typename T , access::address_space AS>`

```
using trisycl::detail::address_space_base< T, AS >::opencl_type = typename ocl_type<T, AS>::type
```

Store the base type of the object with OpenCL address space modifier.

Todo Add to the specification

Definition at line 154 of file address_space.hpp.

9.11.2.10.1.2 type `template<typename T , access::address_space AS>`

```
using trisycl::detail::address_space_base< T, AS >::type = T
```

Store the base type of the object.

Todo Add to the specification

Definition at line 148 of file address_space.hpp.

9.11.2.10.2 Member Data Documentation

9.11.2.10.2.1 address_space `template<typename T , access::address_space AS>`

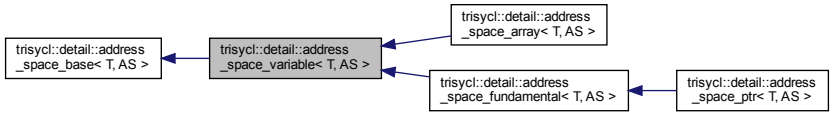
```
auto constexpr trisycl::detail::address_space_base< T, AS >::address_space = AS  [static],
[constexpr]
```

Set the address_space identifier that can be queried to know the pointer type.

Definition at line 158 of file address_space.hpp.

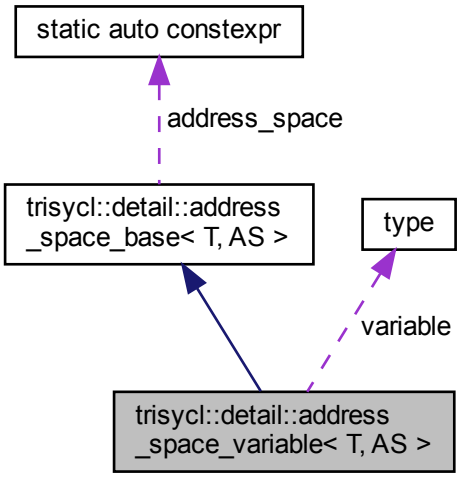
9.11.2.11 struct trisycl::detail::address_space_variable

template<typename T, access::address_space AS>
struct trisycl::detail::address_space_variable< T, AS >



Implementation of a variable with an OpenCL address space.

Parameters



T	is the type of the basic object to be created
AS	is the address space to place the object into

Definition at line 170 of file address_space.hpp.

Inheritance diagram for trisycl::detail::address_space_variable< T, AS >:

Collaboration diagram for trisycl::detail::address_space_variable< T, AS >:

Public Types

- using opencl_type = typename ocl_type< T, AS >::type

  Store the base type of the object with OpenCL address space modifier.
- using super = address_space_base< T, AS >

  Keep track of the base class as a short-cut.

Public Member Functions

- address_space_variable (const T &v)

  Allow to create an address space version of an object or to convert one to be used by the classes inheriting by this one because it is not possible to directly initialize a base class member in C++.
- address_space_variable ()=default

  Put back the default constructors canceled by the previous definition.
- operator opencl_type & ()

  Conversion operator to allow a address_space_object<T> to be used as a T so that all the methods of a T and the built-in operators for T can be used on a address_space_object<T> too.
- opencl_type * get_address ()

  Return the address of the value to implement pointers.

Protected Attributes

- opencl_type variable

Additional Inherited Members

9.11.2.11.1 Member Typedef Documentation

9.11.2.11.1.1 opencl_type

```
template<typename T , access::address_space AS>
using trisycl::detail::address_space_variable< T, AS >::opencl_type = typename ocl_type<T,
AS>::type
```

Store the base type of the object with OpenCL address space modifier.

Todo Add to the specification

Definition at line 175 of file address_space.hpp.

9.11.2.11.1.2 super

```
template<typename T , access::address_space AS>
using trisycl::detail::address_space_variable< T, AS >::super = address_space_base<T, AS>
```

Keep track of the base class as a short-cut.

Definition at line 178 of file address_space.hpp.

9.11.2.11.4 Member Data Documentation

9.11.2.11.4.1 variable template<typename T , access::address_space AS>

opencl_type trisycl::detail::address_space_variable< T, AS >::variable [protected]

Definition at line 187 of file address_space.hpp.

Referenced by trisycl::detail::address_space_array< T, AS >::address_space_array(), trisycl::detail::address_space_fundamental< T
trisycl::detail::address_space_variable< T, AS >::get_address(), and trisycl::detail::address_space_variable< T, AS >::operator ope

9.11.3 Typedef Documentation

9.11.3.1 addr_space

```
template<typename T , access::address_space AS>
using trisycl::detail::addr_space = typedef typename std::conditional<std::is_pointer<T>↩
::value, address_space_ptr<T, AS>, typename std::conditional<std::is_class<T>::value, address_space_object<T
AS>, typename std::conditional<std::is_array<T>::value, address_space_array<T, AS>, address_space_fundamenta
AS> >::type>::type>::type
```

#include <include/triSYCL/address_space/detail/address_space.hpp>

Dispatch the address space implementation according to the requested type.

Parameters

T	is the type of the object to be created
AS	is the address space to place the object into or to point to in the case of a pointer type

Definition at line 122 of file address_space.hpp.

9.11.3.2 constant

```
template<typename T >
using trisycl::constant = typedef detail::addr_space<T, access::address_space::constant_space>
```

```
#include <include/triSYCL/address_space.hpp>
```

Declare a variable to be in the OpenCL constant address space.

Parameters

T	is the type of the object

Definition at line 54 of file address_space.hpp.

9.11.3.3 constant_ptr

```
template<typename T >
using trisycl::constant_ptr = typedef constant<T*>
```

```
#include <include/triSYCL/address_space.hpp>
```

Declare a variable to be in the OpenCL constant address space.

Parameters

T	is the type of the object

Definition at line 62 of file address_space.hpp.

9.11.3.4 generic

```
template<typename T >
using trisycl::generic = typedef detail::addr_space<T, access::address_space::generic_space>
```

```
#include <include/triSYCL/address_space.hpp>
```

Declare a variable to be in the OpenCL 2 generic address space.

Parameters

T	is the type of the object

Definition at line 70 of file address_space.hpp.

9.11.3.5 global

```
template<typename T >
using trisycl::global = typedef detail::addr_space<T, access::address_space::global_space>
```

```
#include <include/triSYCL/address_space.hpp>
```

Declare a variable to be in the OpenCL global address space.

Parameters

T	is the type of the object

Definition at line 78 of file address_space.hpp.

9.11.3.6 global_ptr

```
template<typename T >
using trisycl::global_ptr = typedef global<T*>
```

```
#include <include/triSYCL/address_space.hpp>
```

Declare a variable to be in the OpenCL global address space.

Parameters

T	is the type of the object

Definition at line 87 of file address_space.hpp.

9.11.3.7 local

```
template<typename T >
using trisycl::local = typedef detail::addr_space<T, access::address_space::local_space>
```

```
#include <include/triSYCL/address_space.hpp>
```

Declare a variable to be in the OpenCL local address space.

Parameters

T	is the type of the object

Definition at line 95 of file address_space.hpp.

9.11.3.8 local_ptr

```
template<typename T >
using trisycl::local_ptr = typedef local<T*>
```

```
#include <include/triSYCL/address_space.hpp>
```

Declare a variable to be in the OpenCL local address space.

Parameters

T	is the type of the object

Definition at line 103 of file address_space.hpp.

9.11.3.9 multi_ptr

```
template<typename Pointer , access::address_space AS>
using trisycl::multi_ptr = typedef detail::address_space_ptr<Pointer, AS>
```

```
#include <include/triSYCL/address_space.hpp>
```

A pointer that can be statically associated to any address-space.

Parameters

Pointer	is the pointer type
AS	is the address space to point to

Note that if *Pointer* is not a pointer type, it is an error.

Definition at line 131 of file address_space.hpp.

9.11.3.10 priv

```
template<typename T >
using trisycl::priv = typedef detail::addr_space<T, access::address_space::private_space>
```

```
#include <include/triSYCL/address_space.hpp>
```

Declare a variable to be in the OpenCL private address space.

Parameters

T	is the type of the object

Definition at line 111 of file address_space.hpp.

9.11.3.11 private_ptr

```
template<typename T >
using trisycl::private_ptr = typedef priv<T*>
```

```
#include <include/triSYCL/address_space.hpp>
```

Declare a variable to be in the OpenCL private address space.

Parameters

T	is the type of the object

Definition at line 119 of file address_space.hpp.

9.11.4 Function Documentation

9.11.4.1 make_ptr() [1/2]

```
template<typename T , access::address_space AS>
multi_ptr< T, AS > trisycl::make_ptr (
            multi_ptr< T, AS > pointer )
```

```
#include <include/triSYCL/address_space.hpp>
```

Construct a trisycl::multi_ptr<> with the right type.

Parameters

pointer	is the address with its address space to point to

Definition at line 140 of file address_space.hpp.

```
00140                                                 {
00141   return pointer;
00142 }
```

9.11.4.2 make_ptr() [2/2]

```
template<typename T , access::address_space AS>
multi_ptr< T, AS > trisycl::make_ptr (
             T * pointer )
```

```
#include <include/triSYCL/address_space.hpp>
```

Construct a trisycl::multi_ptr<> with the right type.

Todo Implement the case with a plain pointer

Definition at line 149 of file address_space.hpp.

```
00149                                        {
00150   TRISYCL_UNIMPL;
00151   return pointer;
00152 }
```

References TRISYCL_UNIMPL.

9.12 Helpers to do array and tuple conversion

Classes

- struct trisycl::detail::expand_to_vector< V, Tuple, expansion >

  Allows optional expansion of a 1-element tuple to a V::dimension tuple to replicate scalar values in vector initialization. More...
- struct trisycl::detail::expand_to_vector< V, Tuple, true >

  Specialization in the case we ask for expansion. More...

Functions

- template<typename V , typename Tuple , std::size_t... Is>
  std::array< typename V::element_type, V::dimension > trisycl::detail::tuple_to_array_iterate (Tuple t, std::index_sequence< Is... >)

  Helper to construct an array from initializer elements provided as a tuple.
- template<typename V , typename Tuple >
  auto trisycl::detail::tuple_to_array (Tuple t)

  Construct an array from initializer elements provided as a tuple.
- static auto trisycl::detail::expand_to_vector< V, Tuple, expansion >::expand (Tuple t)
- template<typename Value , std::size_t... Is>
  static auto trisycl::detail::expand_to_vector< V, Tuple, true >::fill_tuple (Value e, std::index_sequence< Is... >)

  Construct a tuple from a value.
- static auto trisycl::detail::expand_to_vector< V, Tuple, true >::expand (Tuple t)

  We expand the 1-element tuple by replicating into a tuple with the size of the vector.
- template<typename V , typename Tuple >
  auto trisycl::detail::expand (Tuple t)

  Create the array data of V from a tuple of initializer.

9.12.1 Detailed Description

9.12.2 Class Documentation

9.12.2.1 struct trisycl::detail::expand_to_vector

template<typename V, typename Tuple, bool expansion = false>
struct trisycl::detail::expand_to_vector< V, Tuple, expansion >

Allows optional expansion of a 1-element tuple to a V::dimension tuple to replicate scalar values in vector initialization.

Definition at line 62 of file array_tuple_helpers.hpp.

Static Public Member Functions

- static auto expand (Tuple t)

9.12.2.2 struct trisycl::detail::expand_to_vector< V, Tuple, true >

template<typename V, typename Tuple>
struct trisycl::detail::expand_to_vector< V, Tuple, true >

Specialization in the case we ask for expansion.

Definition at line 72 of file array_tuple_helpers.hpp.

Static Public Member Functions

- template<typename Value , std::size_t... Is>
  static auto fill_tuple (Value e, std::index_sequence< Is... >)

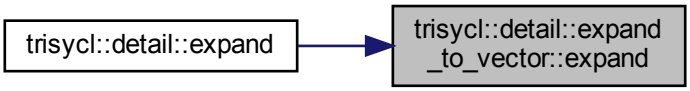
  Construct a tuple from a value.
- static auto expand (Tuple t)

  We expand the 1-element tuple by replicating into a tuple with the size of the vector.

9.12.3 Function Documentation

9.12.3.1 expand() [1/3]

```
template<typename V , typename Tuple , bool expansion = false>
static auto trisycl::detail::expand_to_vector< V, Tuple, expansion >::expand (
             Tuple t )  [inline], [static]
```



#include <include/triSYCL/detail/array_tuple_helpers.hpp>

Definition at line 68 of file array_tuple_helpers.hpp.

```
00068 { return t; }
```

Referenced by trisycl::detail::expand().

Here is the caller graph for this function:

9.12.3.2 expand() [2/3]

```
template<typename V , typename Tuple >
static auto trisycl::detail::expand_to_vector< V, Tuple, true >::expand (
             Tuple t )  [inline], [static]
```

#include <include/triSYCL/detail/array_tuple_helpers.hpp>

We expand the 1-element tuple by replicating into a tuple with the size of the vector.

Definition at line 104 of file array_tuple_helpers.hpp.

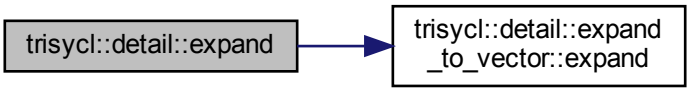
```
00104                                    {
00105     return fill_tuple(std::get<0>(t),
00106                       std::make_index_sequence<V::dimension>{});
00107   }
```

9.12.3.3 expand() [3/3]

```
template<typename V , typename Tuple >
auto trisycl::detail::expand (
             Tuple t )
```

`#include <include/triSYCL/detail/array_tuple_helpers.hpp>`

Create the array data of V from a tuple of initializer.



If there is only 1 initializer, this is a scalar initialization of a vector and the value is expanded to all the vector elements first.

Definition at line 116 of file array_tuple_helpers.hpp.

```
00116                     {
00117   return tuple_to_array<V>(expand_to_vector<V,
00118                             decltype(t),
00119                             /* Only ask the expansion to all vector
00120 element if there only a scalar
00121 initializer */
00122                             std::tuple_size_v<Tuple> == 1>{}.expand(t));
00123 }
```

References trisycl::detail::expand_to_vector< V, Tuple, expansion >::expand().

Here is the call graph for this function:

9.12.3.4 fill_tuple()

```
template<typename V , typename Tuple >
template<typename Value , std::size_t...  Is>
static auto trisycl::detail::expand_to_vector< V, Tuple, true >::fill_tuple (
             Value e,
             std::index_sequence< Is...  >  )  [inline], [static]
```

`#include <include/triSYCL/detail/array_tuple_helpers.hpp>`

Construct a tuple from a value.

Parameters

value	is used to initialize each tuple element
size	is the number of elements of the tuple to be generated

The trick is to get the std::index_sequence<> that represent 0, 1,..., dimension-1 as a variadic template pack Is that we can iterate on, in this function.

Definition at line 88 of file array_tuple_helpers.hpp.

```
00088                                                                    {
00089     /* The effect is like a static for-loop with Is counting from 0 to
00090 dimension-1 and thus replicating the pattern to have
00091 make_tuple( (0, e), (1, e), ...  (n - 1, e) )
00092
00093 Since the "," operator is just here to throw away the Is value
00094 (which is needed for the pack expansion...), at the end this is
00095 equivalent to:
00096 make_tuple( e, e, ..., e )
00097 */
00098     return std::make_tuple(((void)Is, e)...);
00099   }
```

9.12.3.5 tuple_to_array()

```
template<typename V , typename Tuple >
auto trisycl::detail::tuple_to_array (
             Tuple t )
```

```
#include <include/triSYCL/detail/array_tuple_helpers.hpp>
```

Construct an array from initializer elements provided as a tuple.

Definition at line 51 of file array_tuple_helpers.hpp.

```
00051                                {
00052   /* Construct an index_sequence with 0, 1, ..., (size of the tuple-1)
00053 so that tuple_to_array_iterate can statically iterate on it */
00054   return tuple_to_array_iterate<V>(
00055       t, std::make_index_sequence<std::tuple_size_v<Tuple» {});
00056 }
```

9.12.3.6 tuple_to_array_iterate()

```
template<typename V , typename Tuple , std::size_t...  Is>
std::array< typename V::element_type, V::dimension > trisycl::detail::tuple_to_array_iterate (
             Tuple t,
             std::index_sequence< Is...  >  )
```

```
#include <include/triSYCL/detail/array_tuple_helpers.hpp>
```

Helper to construct an array from initializer elements provided as a tuple.

The trick is to get the std::index_sequence<> that represent 0, 1,..., dimension-1 as a variadic template pack Is that we can iterate on, in this function.

Definition at line 35 of file array_tuple_helpers.hpp.

```
00035                                                                  {
00036   /* The effect is like a static for-loop with Is counting from 0 to
00037 dimension-1 and thus constructing a uniform initialization { }
00038 construction from each tuple element:
00039 { std::get<0>(t), std::get<1>(t), ..., std::get<dimension-1>(t) }
00040
00041 The static cast is here to avoid the warning when there is a loss
00042 of precision, for example when initializing an int from a float.
00043 */
00044   return { { static_cast<typename V::element_type>(std::get<Is>(t))...  } };
00045 }
```

9.13 Some helpers for the implementation

Concepts

- concept trisycl::detail::is_small_array

  Concept describing a class inheriting from small_array.

Classes

- struct trisycl::detail::container_element_aspect< T >

  A mix-in to add some container element aspects. More...
- struct trisycl::detail::overloaded< Ts >

  Helper type for the visitor to do pattern matching on invocables https://en.cppreference.com/w/cpp/utility/variant/visit. More...
- struct trisycl::detail::small_array_tag

  Tag to define simply inheritance from small_array. More...
- struct trisycl::detail::small_array< BasicType, FinalType, Dims >

  Define a multi-dimensional index, used for example to locate a work item or a buffer element. More...
- struct trisycl::detail::small_array_sycl< BasicType, FinalType, Dims >

  A small array to implement SYCL objects like id, range, item... with 1, 2 or 3 elements (or even more if detail::allow_any_dimension is true), with the implicit constructors. More...

Macros

- #define TRISYCL_BOOST_OPERATOR_VECTOR_OP(op)

  Helper macro to declare a vector operation with the given side-effect operator.
- #define TRISYCL_LOGICAL_OPERATOR_VECTOR_OP(op)

  Helper macro to declare a vector operation returning a new type containing the result of the operator.
- #define TRISYCL_UNARY_OPERATOR_VECTOR_OP(op)

  Helper macro to declare a vector unary operation.
- #define TRISYCL_UNARY_PREFIX_OPERATOR_VECTOR_OP(op)

  Helper macro to declare a vector prefix unary operation.
- #define TRISYCL_UNARY_POSTFIX_OPERATOR_VECTOR_OP(op)

  Helper macro to declare a vector prefix unary operation.
- #define TRISYCL_OPERATOR_BASIC_TYPE_OP(op)

  Helper macro to declare out-of-class operators for b vs a[] operations.
- #define TRISYCL_UNIMPL trisycl::detail::unimplemented(__func__, __FILE__, __LINE__)

Functions

- template<typename Range , typename Id >
  size_t constexpr trisycl::detail::linear_id (Range range, Id id, Id offset={})

  Compute a linearized array access used in the OpenCL 2 world.
- template<class... Ts>
  trisycl::detail::overloaded (Ts...) -> overloaded< Ts... >
- void trisycl::detail::unimplemented (const char *func, const char *file, int line)

  Display an "unimplemented" message.

9.13.1 Detailed Description

9.13.2 Class Documentation

9.13.2.1 struct trisycl::detail::container_element_aspect

template<typename T>
struct trisycl::detail::container_element_aspect< T >

A mix-in to add some container element aspects.

Definition at line 21 of file container_element_aspect.hpp.

Public Types

- using value_type = T
- using pointer = value_type *
- using const_pointer = const value_type *
- using reference = value_type &
- using const_reference = const value_type &

9.13.2.1.1 Member Typedef Documentation

9.13.2.1.1.1 const_pointer template<typename T >

```
using trisycl::detail::container_element_aspect< T >::const_pointer = const value_type*
```

Definition at line 25 of file container_element_aspect.hpp.

9.13.2.1.1.2 const_reference template<typename T >

```
using trisycl::detail::container_element_aspect< T >::const_reference = const value_type&
```

Definition at line 27 of file container_element_aspect.hpp.

9.13.2.1.1.3 pointer template<typename T >

```
using trisycl::detail::container_element_aspect< T >::pointer = value_type*
```

Definition at line 24 of file container_element_aspect.hpp.

9.13.2.1.1.4 reference template<typename T >

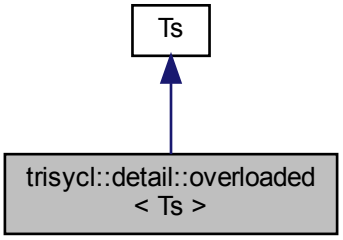
9.13.2.1.1.5 value_type template<typename T >

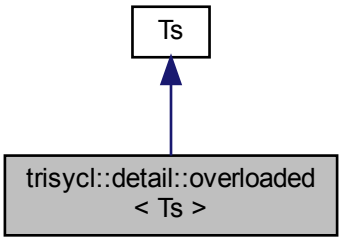
```
using trisycl::detail::container_element_aspect< T >::value_type = T
```

Definition at line 23 of file container_element_aspect.hpp.



9.13.2.2 struct trisycl::detail::overloaded

template<class... Ts>
struct trisycl::detail::overloaded< Ts >

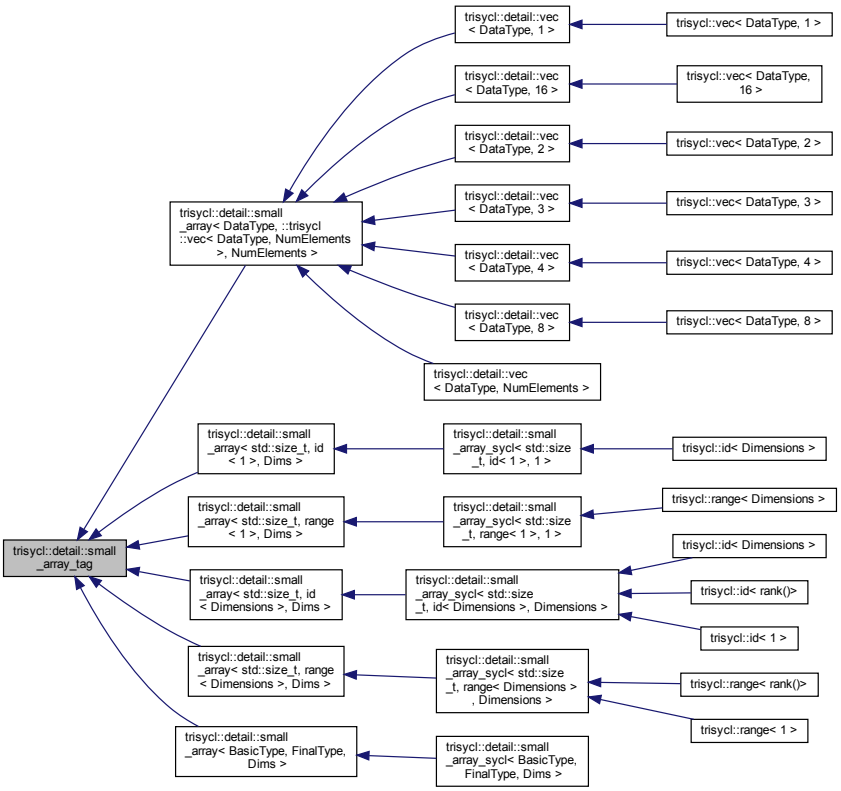


Helper type for the visitor to do pattern matching on invocables https://en.cppreference.com/w/cpp/utility/variant/visit.

Definition at line 18 of file overloaded.hpp.

Inheritance diagram for trisycl::detail::overloaded< Ts >:

Collaboration diagram for trisycl::detail::overloaded< Ts >:



9.13.2.3 struct trisycl::detail::small_array_tag

Tag to define simply inheritance from small_array.

Definition at line 36 of file small_array.hpp.

Inheritance diagram for trisycl::detail::small_array_tag:

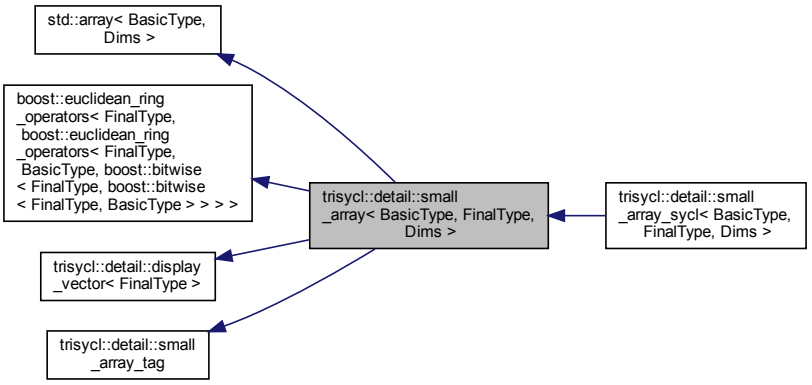
9.13.2.4 struct trisycl::detail::small_array

template<typename BasicType, typename FinalType, std::size_t Dims>
struct trisycl::detail::small_array< BasicType, FinalType, Dims >

Define a multi-dimensional index, used for example to locate a work item or a buffer element.

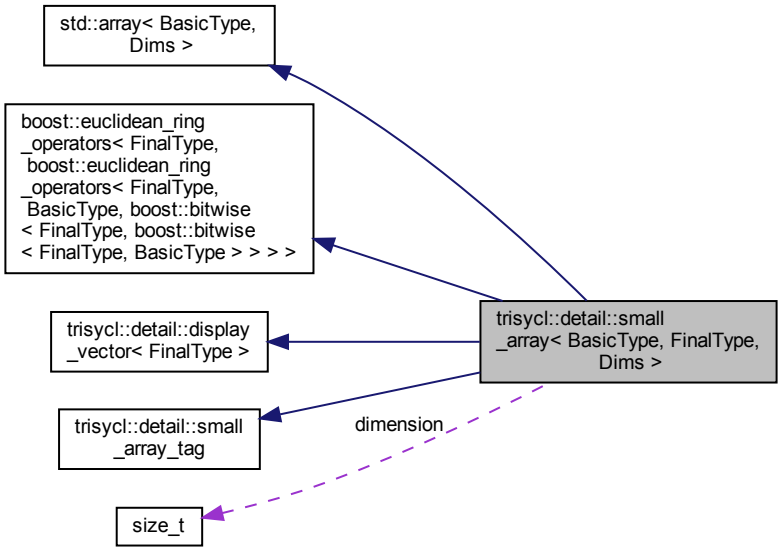
Unfortunately, even if std::array is an aggregate class allowing native list initialization, it is no longer an aggregate if we derive from an aggregate. Thus we have to redeclare the constructors.

Parameters



BasicType	is the type element, such as int
Dims	is the dimension number, typically between 1 and 3
FinalType	is the final type, such as range<> or id<>, so that boost::operator can return the right type

std::array<> provides the collection concept, with .size(), == and != too.



Can't use boost::shiftable, as it doesn't define the U, T overload outside the class, but when that is added, it gets ambiguity problems.

Definition at line 140 of file small_array.hpp.

Inheritance diagram for trisycl::detail::small_array< BasicType, FinalType, Dims >:

Collaboration diagram for trisycl::detail::small_array< BasicType, FinalType, Dims >:

Public Types

- using element_type = BasicType

Public Member Functions

- template<typename SourceType >
  small_array (const SourceType src[Dims])

  A constructor from another array.
- template<typename SourceBasicType , typename SourceFinalType >
  small_array (const small_array< SourceBasicType, SourceFinalType, Dims > &src)

  A constructor from another small_array of the same size.
- template<typename... Types>
  requires (sizeof...(Types) == Dims)
  small_array (const Types &... args)

  Initialize the array from a list of exactly Dims elements.
- template<typename SourceBasicType >
  small_array (const std::array< SourceBasicType, Dims > &src)

  Construct a small_array from a std::array.
- small_array ()=default

  Keep the synthesized constructors.
- auto get (std::size_t index) const

  Return the element of the array.
- operator FinalType ()

  Add + like operations on the id<> and others.

Static Public Attributes

- static constexpr size_t dimension = Dims

9.13.2.4.1 Member Typedef Documentation

9.13.2.4.1.1 element_type

```
template<typename BasicType , typename FinalType , std::size_t Dims>
using trisycl::detail::small_array< BasicType, FinalType, Dims >::element_type = BasicType
```

Definition at line 161 of file small_array.hpp.

9.13.2.4.2 Constructor & Destructor Documentation

9.13.2.4.2.1 small_array() [1/5]

```
template<typename BasicType , typename FinalType , std::size_t
Dims>
template<typename SourceType >
trisycl::detail::small_array< BasicType, FinalType, Dims >::small_array (
            const SourceType src[Dims] )  [inline]
```

A constructor from another array.

Make it explicit to avoid spurious range<> constructions from int * for example

Definition at line 169 of file small_array.hpp.

```
00170                                       {
00171     // (*this)[0] is the first element of the underlying array
00172     std::copy_n(src, Dims, &(*this)[0]);
```

References src.

9.13.2.4.2.2 small_array() [2/5]

```
template<typename BasicType , typename FinalType , std::size_t
Dims>
template<typename SourceBasicType , typename SourceFinalType >
trisycl::detail::small_array< BasicType, FinalType, Dims >::small_array (
            const small_array< SourceBasicType, SourceFinalType, Dims > & src )  [inline]
```

A constructor from another small_array of the same size.

Definition at line 178 of file small_array.hpp.

```
00181                                {
00182     std::copy_n(&src[0], Dims, &(*this)[0]);
```

References src.

9.13.2.4.2.3 small_array() [3/5]

```
template<typename BasicType , typename FinalType , std::size_t
Dims>
template<typename... Types>
requires (sizeof...(Types) == Dims)
trisycl::detail::small_array< BasicType, FinalType, Dims >::small_array (
            const Types &... args )  [inline]
```

Initialize the array from a list of exactly Dims elements.

Strangely, even when using the array constructors, the initialization of the aggregate is not available. So recreate an equivalent here.

Definition at line 192 of file small_array.hpp.

```
00194       :  std::array<BasicType, Dims> {
00195         // Allow a loss of precision in initialization with the static_cast
00196         { static_cast<BasicType>(args)... }
```

9.13.2.4.2.4 small_array() [4/5]

```
template<typename BasicType , typename FinalType , std::size_t
Dims>
template<typename SourceBasicType >
trisycl::detail::small_array< BasicType, FinalType, Dims >::small_array (
            const std::array< SourceBasicType, Dims > & src )  [inline]
```

Construct a small_array from a std::array.

Definition at line 200 of file small_array.hpp.

```
00202     :  std::array<BasicType, Dims>(src) {}
```

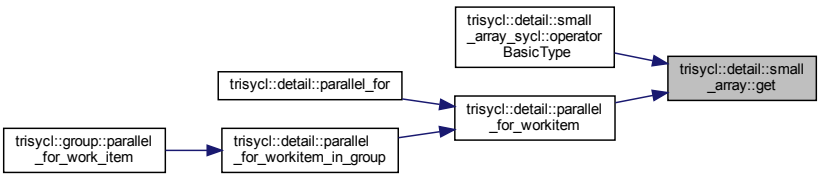
9.13.2.4.2.5 small_array() [5/5]

```
template<typename BasicType , typename FinalType , std::size_t
Dims>
trisycl::detail::small_array< BasicType, FinalType, Dims >::small_array ( )  [default]
```

Keep the synthesized constructors.

9.13.2.4.3 Member Function Documentation

9.13.2.4.3.1 get() template<typename BasicType , typename FinalType , std::size_t Dims> auto trisycl::detail::small_array< BasicType, FinalType, Dims >::get (std::size_t *index*) const [inline]



Return the element of the array.

Definition at line 211 of file small_array.hpp.

```
00212                                 {
00213     return (*this)[index];
```

Referenced by trisycl::detail::small_array_sycl< BasicType, FinalType, Dims >::operator BasicType(), and trisycl::detail::parallel_for_workitem().

Here is the caller graph for this function:

9.13.2.4.3.2 operator FinalType() template<typename BasicType , typename FinalType , std::size_t Dims> trisycl::detail::small_array< BasicType, FinalType, Dims >::operator FinalType ( ) [inline]

Add + like operations on the id<> and others.

Add - like operations on the id<> and others Add * like operations on the id<> and others Add / like operations on the id<> and others Add % like operations on the id<> and others Add << like operations on the id<> and others Add >> like operations on the id<> and others Add & like operations on the id<> and others Add ^ like operations on the id<> and others Add | like operations on the id<> and others Add && operations on the id<> and others Add || operations on the id<> and others Add comparison operations on the id<> and others Add shiftable operators on the vector op Implement unary operations Implement prefix unary operations Implement postfix unary operations Since the boost::operator work on the small_array, add an implicit conversion to produce the expected type

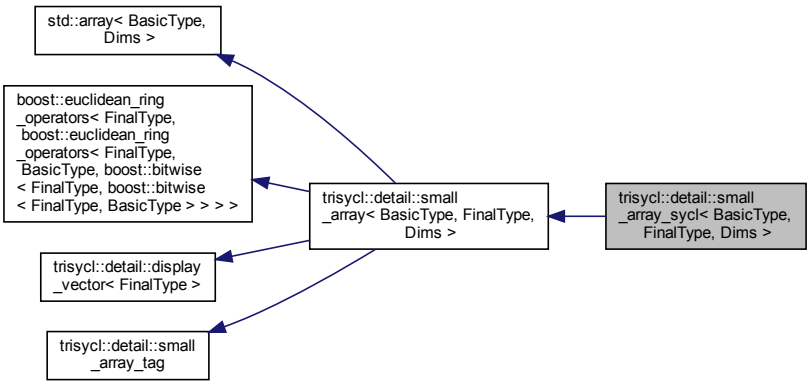
Definition at line 287 of file small_array.hpp.

```
00288                           {
00289     return static_cast<FinalType&>(*this);
```

9.13.2.4.4 Member Data Documentation

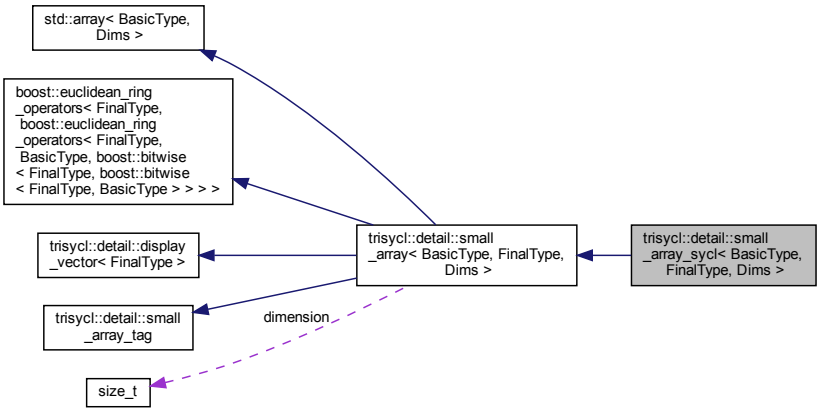
9.13.2.4.4.1 dimension template<typename BasicType , typename FinalType , std::size_t Dims> constexpr size_t trisycl::detail::small_array< BasicType, FinalType, Dims >::dimension = Dims [static], [constexpr]

Definition at line 159 of file small_array.hpp.



9.13.2.5 struct trisycl::detail::small_array_sycl

template<typename BasicType, typename FinalType, std::size_t Dims>
struct trisycl::detail::small_array_sycl< BasicType, FinalType, Dims >



A small array to implement SYCL objects like id, range, item... with 1, 2 or 3 elements (or even more if detail::allow_any_dimension is true), with the implicit constructors.

Definition at line 325 of file small_array.hpp.

Inheritance diagram for trisycl::detail::small_array_sycl< BasicType, FinalType, Dims >:

Collaboration diagram for trisycl::detail::small_array_sycl< BasicType, FinalType, Dims >:

Public Member Functions

- small_array_sycl ()=default

  Keep other constructors.

- template<typename Range >
  requires requires { ranges::copy(std::declval<Range>(), std::declval<BasicType*>()); }
  small_array_sycl (Range &&r)

  Construct from a range-like object inheriting from a compatible std::array.
- template<typename... Args>
  requires requires { (static_cast<BasicType>(std::declval<Args>()), ...); }
  small_array_sycl (Args... args)

  Constructor taking either Dims arguments compatible with BasicType or just 1 argument compatible with BasicType and broadcast its value to all the elements.
- template<auto T = Dims>
  requires (Dims == 1)
  operator BasicType ()

  Conversion operator to scalar BasicType when only 1 dimension.

Additional Inherited Members

9.13.2.5.1 Constructor & Destructor Documentation

9.13.2.5.1.1 small_array_sycl() [1/3]

```
template<typename BasicType , typename FinalType , std::size_t Dims>
trisycl::detail::small_array_sycl< BasicType, FinalType, Dims >::small_array_sycl ( )  [default]
```

Keep other constructors.

9.13.2.5.1.2 small_array_sycl() [2/3]

```
template<typename BasicType , typename FinalType , std::size_t Dims>
template<typename Range >
requires requires { ranges::copy(std::declval<Range>(), std::declval<BasicType*>()); }
trisycl::detail::small_array_sycl< BasicType, FinalType, Dims >::small_array_sycl (
            Range && r )  [inline]
```

Construct from a range-like object inheriting from a compatible std::array.

This useful in implementation details for example to construct a sycl::id from a sycl::range.

Definition at line 343 of file small_array.hpp.

```
00344                                {
00345     // Copy to internal value
00346     ranges::copy(std::forward<Range>(r), this->begin());
```

9.13.2.5.1.3 small_array_sycl() [3/3]

```
template<typename BasicType , typename FinalType , std::size_t Dims>
template<typename... Args>
requires requires { (static_cast<BasicType>(std::declval<Args>()), ...); }
trisycl::detail::small_array_sycl< BasicType, FinalType, Dims >::small_array_sycl (
            Args... args ) [inline]
```

Constructor taking either Dims arguments compatible with BasicType or just 1 argument compatible with BasicType and broadcast its value to all the elements.

Definition at line 356 of file small_array.hpp.

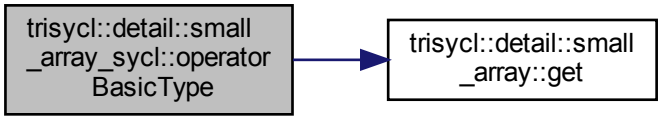
```
00356                     { (static_cast<BasicType>(std::declval<Args>()), ...); }
00357   small_array_sycl(Args... args) {
00358     if constexpr (sizeof...(Args) == Dims) {
00359       // If there is the right number of elements we initialize each
00360       // element from each parameter, allowing some narrowing
00361       static_cast<std::array<BasicType, Dims>&>(
00362           *this) = { static_cast<BasicType>(args)... };
00363     } else if constexpr (sizeof...(Args) == 1) {
00364       // If there is only 1 argument, this is a broadcast
00365       detail::assign_from_tuple(
00366           static_cast<std::array<BasicType, Dims>&>(*this),
00367           detail::expand_to_vector<small_array_sycl, std::tuple<BasicType>,
00368                                    true> {}
00369               .expand(args...));
00370     } else
00371       static_assert(true, "There should be either 1 argument to broadcast the "
00372                           "value or 1 value per dimension");
```

9.13.2.5.2 Member Function Documentation

9.13.2.5.2.1 operator BasicType()

```
template<typename BasicType , typename FinalType , std::size_t Dims>
template<auto T = Dims>
requires (Dims == 1)
trisycl::detail::small_array_sycl< BasicType, FinalType, Dims >::operator BasicType ( ) [inline]
```

Conversion operator to scalar BasicType when only 1 dimension.



This is used for example to implicitly convert a sycl::id<1> to a std::size_t

Definition at line 381 of file small_array.hpp.

```
00382                           {
00383     return this->get(0);
```

References trisycl::detail::small_array< BasicType, FinalType, Dims >::get().

Here is the call graph for this function:

9.13.3 Macro Definition Documentation

9.13.3.1 TRISYCL_BOOST_OPERATOR_VECTOR_OP

```
#define TRISYCL_BOOST_OPERATOR_VECTOR_OP(
              op )
```

```
#include <include/triSYCL/detail/small_array.hpp>
```

Value:

```
  FinalType operator op(const FinalType &rhs) {          \
    for (std::size_t i = 0; i != Dims; ++i)              \
      (*this)[i] op rhs[i];                              \
    return *this;                                        \
  }                                                      \
  FinalType operator op(const BasicType &rhs) {          \
    for (std::size_t i = 0; i != Dims; ++i)              \
      (*this)[i] op rhs;                                 \
    return *this;                                        \
  }                                                      \
```

Helper macro to declare a vector operation with the given side-effect operator.

This handles both a[i] op b[i] and a[i] op b, where b is a BasicType.

Definition at line 47 of file small_array.hpp.

9.13.3.2 TRISYCL_LOGICAL_OPERATOR_VECTOR_OP

```
#define TRISYCL_LOGICAL_OPERATOR_VECTOR_OP(
              op )
```

```
#include <include/triSYCL/detail/small_array.hpp>
```

Value:

```
  FinalType operator op(const FinalType &rhs)const {             \
    FinalType res;                                                \
    for (std::size_t i = 0; i != Dims; ++i)                       \
      res[i] = (*this)[i] op rhs[i];                              \
    return res;                                                   \
  }                                                               \
  /* Skip this for Dims = 1 to avoid ambiguity with implicit type \
conversion between the vector type and its basic type */      \
  template <typename FT = FinalType,                              \
            typename = std::enable_if_t<Dims != 1, FT>>           \
  FinalType operator op(const BasicType &rhs) {                   \
    FinalType res;                                                \
    for (std::size_t i = 0; i != Dims; ++i)                       \
      res[i] = (*this)[i] op rhs;                                 \
    return res;                                                   \
  }
```

Helper macro to declare a vector operation returning a new type containing the result of the operator.

This handles both a[] op b[] and a[] op b, where b is a BasicType.

Definition at line 64 of file small_array.hpp.

9.13.3.3 TRISYCL_OPERATOR_BASIC_TYPE_OP

```
#define TRISYCL_OPERATOR_BASIC_TYPE_OP(
              op )
```

```
#include <include/triSYCL/detail/small_array.hpp>
```

Value:

```
template <typename BasicType, typename FinalType, std::size_t Dims>    \
struct small_array<BasicType, FinalType, Dims> operator op(            \
  const BasicType &lhs,                                                \
  const struct small_array<BasicType, FinalType, Dims> &rhs)           \
{                                                                      \
  FinalType res;                                                       \
  for (std::size_t i = 0; i != Dims; ++i)                              \
    res[i] = lhs op rhs[i];                                            \
  return res;                                                          \
}
```

Helper macro to declare out-of-class operators for b vs a[] operations.

Definition at line 295 of file small_array.hpp.

9.13.3.4 TRISYCL_UNARY_OPERATOR_VECTOR_OP

```
#define TRISYCL_UNARY_OPERATOR_VECTOR_OP(
              op )
```

```
#include <include/triSYCL/detail/small_array.hpp>
```

Value:

```
  FinalType operator op()const {                \
    FinalType result;                            \
    for (std::size_t i = 0; i != Dims; ++i)      \
      result[i] = op(*this)[i];                  \
    return result;                               \
  }
```

Helper macro to declare a vector unary operation.

This handles op a.

Definition at line 85 of file small_array.hpp.

9.13.3.5 TRISYCL_UNARY_POSTFIX_OPERATOR_VECTOR_OP

```
#define TRISYCL_UNARY_POSTFIX_OPERATOR_VECTOR_OP(
              op )
```

```
#include <include/triSYCL/detail/small_array.hpp>
```

Value:

```
  FinalType operator op(int) {                  \
    FinalType result = *this;                    \
    for (std::size_t i = 0; i != Dims; ++i)      \
      op(*this)[i];                              \
    return result;                               \
  }
```

Helper macro to declare a vector prefix unary operation.

This handles a++ and a–.

Definition at line 108 of file small_array.hpp.

9.13.3.6 TRISYCL_UNARY_PREFIX_OPERATOR_VECTOR_OP

```
#define TRISYCL_UNARY_PREFIX_OPERATOR_VECTOR_OP(
              op )
```

```
#include <include/triSYCL/detail/small_array.hpp>
```

Value:

```
  FinalType operator op() {                          \
    for (std::size_t i = 0; i != Dims; ++i)          \
      op(*this)[i];                                  \
    return *this;                                    \
  }
```

Helper macro to declare a vector prefix unary operation.

This handles ++a and –a.

Definition at line 97 of file small_array.hpp.

9.13.3.7 TRISYCL_UNIMPL

```
#define TRISYCL_UNIMPL trisycl::detail::unimplemented(__func__, __FILE__, __LINE__)
```

```
#include <include/triSYCL/detail/unimplemented.hpp>
```

Definition at line 32 of file unimplemented.hpp.

9.13.4 Function Documentation

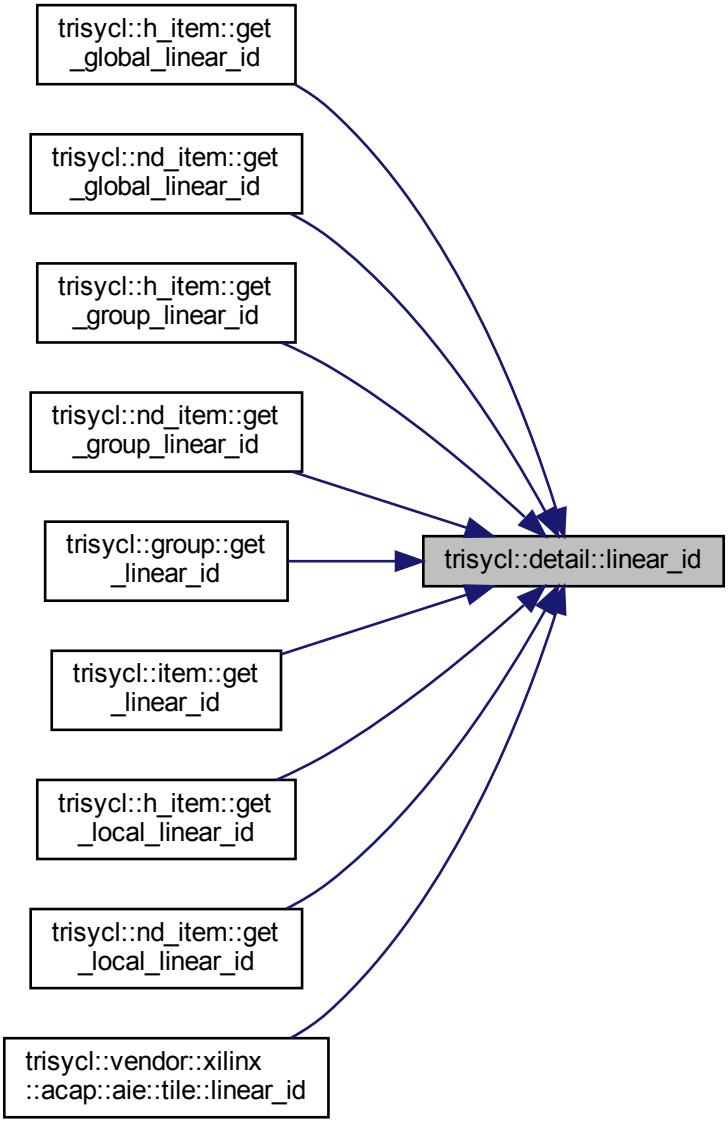
9.13.4.1 linear_id()

```
template<typename Range , typename Id >
size_t constexpr trisycl::detail::linear_id (
             Range range,
             Id id,
             Id offset = {} )  [inline], [constexpr]
```

```
#include <include/triSYCL/detail/linear_id.hpp>
```

Compute a linearized array access used in the OpenCL 2 world.

Typically for the get_global_linear_id() and get_local_linear_id() functions.



Definition at line 26 of file linear_id.hpp.

```
00026                                                                {}) {
00027   auto dims = std::distance(std::begin(range), std::end(range));
00028
00029   size_t linear_id = 0;
00030   /* A good compiler should unroll this and do partial evaluation to
00031 remove the first multiplication by 0 of this Horner evaluation and
00032 remove the 0 offset evaluation */
00033   for (int i = dims - 1; i >= 0; --i)
```

```
00034     linear_id = linear_id*range[i] + id[i] - offset[i];
00035
00036   return linear_id;
00037 }
```

Referenced by trisycl::h_item< Dimensions >::get_global_linear_id(), trisycl::nd_item< Dimensions >::get_global_linear_id(), trisycl::h_item< Dimensions >::get_group_linear_id(), trisycl::nd_item< Dimensions >::get_group_linear_id(), trisycl::group< Dimensions >::get_linear_id(), trisycl::item< Dimensions, with_offset >::get_linear_id(), trisycl::h_item< Dimensions trisycl::nd_item< Dimensions >::get_local_linear_id(), and trisycl::vendor::xilinx::acap::aie::tile< AIE_Program, X, Y >::linear_id().

Here is the caller graph for this function:

9.13.4.2 overloaded()

```
template<class...  Ts>
trisycl::detail::overloaded (
            Ts...    )  -> overloaded< Ts...  >
```

```
#include <include/triSYCL/detail/overloaded.hpp>
```

9.13.4.3 unimplemented()

```
void trisycl::detail::unimplemented (
            const char * func,
            const char * file,
            int line )  [inline]
```

```
#include <include/triSYCL/detail/unimplemented.hpp>
```

Display an "unimplemented" message.

Can be changed to call assert(0) or whatever.

Definition at line 23 of file unimplemented.hpp.

```
00023                                                                        {
00024 #ifndef NDEBUG
00025   std::cerr « "Error:  using a non implemented feature :  " « func « std::endl
00026            « "at " « file « ":" « line « std::endl
00027            « "Please contribute to the open source implementation.  :-)"
00028            « std::endl;
00029 #endif
00030 }
```

9.14 Debugging and tracing support

Classes

- struct trisycl::detail::debug< T >

  Class used to trace the construction, copy-construction, move-construction and destruction of classes that inherit from it. More...
- struct trisycl::detail::display_vector< T >

  Class used to display a vector-like type of classes that inherit from it. More...

Functions

- template<typename KernelName , typename Functor >
  auto trisycl::detail::trace_kernel (Functor f)

  Wrap a kernel functor in some tracing messages to have start/stop information when TRISYCL_TRACE_KERNEL macro is defined.

9.14.1 Detailed Description

9.14.2 Class Documentation

9.14.2.1 struct trisycl::detail::debug

template<typename T>
struct trisycl::detail::debug< T >

Class used to trace the construction, copy-construction, move-construction and destruction of classes that inherit from it.

Also trace the copy and move assignments.

Parameters

T	is the real type name to be used in the debug output.

Definition at line 69 of file debug.hpp.

Static Public Member Functions

- static auto constexpr type_pretty_name ()

  Get the pretty name of T itself.

9.14.2.1.1 Member Function Documentation

9.14.2.1.1.1 type_pretty_name() `template<typename T >`

`static auto constexpr trisycl::detail::debug< T >::type_pretty_name ( ) [inline], [static], [constexpr]`

Get the pretty name of T itself.

Definition at line 71 of file debug.hpp.

```
00071                                          {
00072     return boost::typeindex::type_id<T>().pretty_name();
00073   }
```

9.14.2.2 struct trisycl::detail::display_vector

template<typename T>
struct trisycl::detail::display_vector< T >

Class used to display a vector-like type of classes that inherit from it.

Parameters

T	is the real type name to be used in the debug output.

Calling the display() method dump the values on std::cout

Definition at line 163 of file debug.hpp.

Public Member Functions

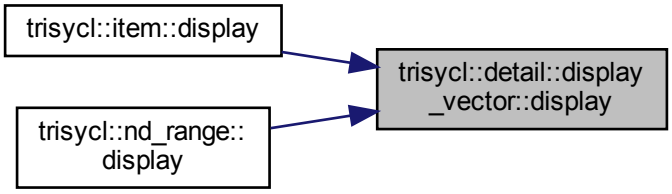
- void display () const

  To debug and test.

9.14.2.2.1 Member Function Documentation

9.14.2.2.1.1 display() template<typename T >

```
void trisycl::detail::display_vector< T >::display ( ) const  [inline]
```



To debug and test.

Definition at line 166 of file debug.hpp.

```
00166                         {
00167 #ifdef TRISYCL_DEBUG
00168     std::cout « boost::typeindex::type_id<T>().pretty_name() « ":";
00169 #endif
00170     // Get a pointer to the real object
00171     for (auto e :  static_cast<const T&>(*this))
00172       std::cout « " " « e;
00173     std::cout « std::endl;
00174   }
```

Referenced by trisycl::item< Dimensions, with_offset >::display(), and trisycl::nd_range< Dimensions >::display().

Here is the caller graph for this function:

9.14.3 Function Documentation

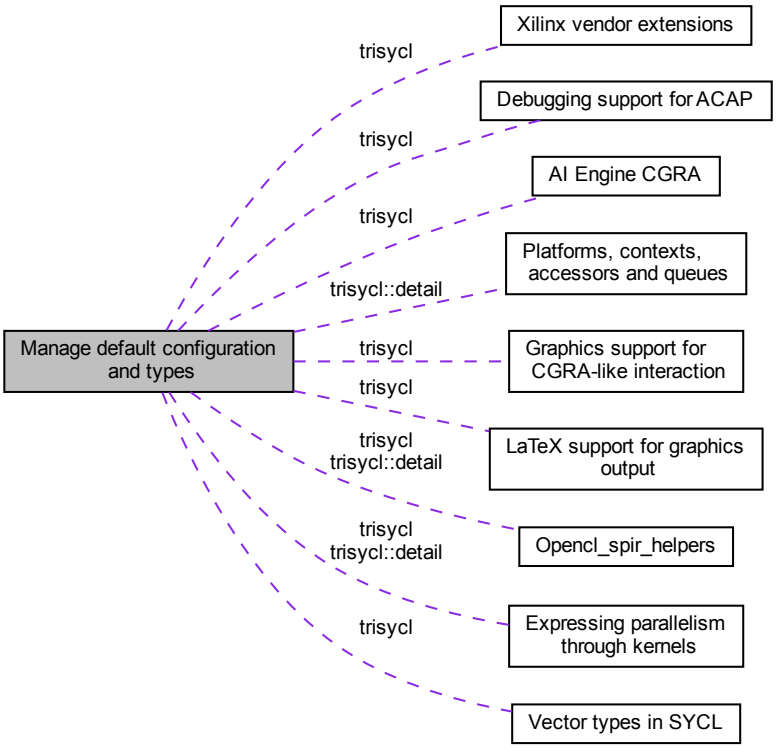
9.14.3.1 trace_kernel()

```
template<typename KernelName , typename Functor >
auto trisycl::detail::trace_kernel (
             Functor f )
```

`#include <include/triSYCL/detail/debug.hpp>`

Wrap a kernel functor in some tracing messages to have start/stop information when TRISYCL_TRACE_KERNEL macro is defined.

Definition at line 133 of file debug.hpp.



```
00133                               {
00134 #ifdef TRISYCL_TRACE_KERNEL
00135   // Inject tracing message around the kernel
00136   return [=] () mutable {
00137     /* Since the class KernelName may just be declared and not really
00138 defined, just use it through a class pointer to have
00139 typeid().name() not complaining */
00140     TRISYCL_INTERNAL_DUMP(
00141       "Kernel started "
00142       « boost::typeindex::type_id<KernelName *>().pretty_name());
00143     f();
```

```
00144     TRISYCL_INTERNAL_DUMP(
00145       "Kernel stopped "
00146       « boost::typeindex::type_id<KernelName *>().pretty_name());
00147   };
00148 #else
00149   // Identity by default
00150   return f;
00151 #endif
00152 }
```

References TRISYCL_INTERNAL_DUMP.

9.15 Manage default configuration and types

Collaboration diagram for Manage default configuration and types:

Namespaces

- namespace trisycl

  The vector type to be used as SYCL vector.
- namespace trisycl::detail

  Some global triSYCL configuration.

Macros

- #define CL_SYCL_LANGUAGE_VERSION 121

  This implements SYCL 1.2.1.
- #define TRISYCL_CL_LANGUAGE_VERSION 121

  This implements triSYCL 1.2.1.
- #define BOOST_COMPUTE_CL_VERSION_1_2
- #define __SYCL_SINGLE_SOURCE__

  This source is compiled by a single source compiler.
- #define TRISYCL_MAKE_BOOST_CIRCULARBUFFER_THREAD_SAFE
- #define TRISYCL_OPENCL_ONLY(...) __VA_ARGS__

  Define TRISYCL_OPENCL to add OpenCL.
- #define TRISYCL_DEVICE_ONLY(...)
- #define TRISYCL_DEBUG_ONLY(...) __VA_ARGS__

9.15.1 Detailed Description

9.15.2 Macro Definition Documentation

9.15.2.1 __SYCL_SINGLE_SOURCE__

```
#define __SYCL_SINGLE_SOURCE__
```

```
#include <include/triSYCL/detail/global_config.hpp>
```

This source is compiled by a single source compiler.

Definition at line 60 of file global_config.hpp.

9.15.2.2 BOOST_COMPUTE_CL_VERSION_1_2

```
#define BOOST_COMPUTE_CL_VERSION_1_2
```

```
#include <include/triSYCL/detail/global_config.hpp>
```

Definition at line 29 of file global_config.hpp.

9.15.2.3 CL_SYCL_LANGUAGE_VERSION

```
#define CL_SYCL_LANGUAGE_VERSION 121
```

```
#include <include/triSYCL/detail/global_config.hpp>
```

This implements SYCL 1.2.1.

Definition at line 21 of file global_config.hpp.

9.15.2.4 TRISYCL_CL_LANGUAGE_VERSION

```
#define TRISYCL_CL_LANGUAGE_VERSION 121
```

```
#include <include/triSYCL/detail/global_config.hpp>
```

This implements triSYCL 1.2.1.

Definition at line 26 of file global_config.hpp.

9.15.2.5 TRISYCL_DEBUG_ONLY

```
#define TRISYCL_DEBUG_ONLY(
              ... ) __VA_ARGS__
```

```
#include <include/triSYCL/detail/global_config.hpp>
```

Definition at line 104 of file global_config.hpp.

9.15.2.6 TRISYCL_DEVICE_ONLY

```
#define TRISYCL_DEVICE_ONLY(
              ... )
```

```
#include <include/triSYCL/detail/global_config.hpp>
```

Definition at line 98 of file global_config.hpp.

9.15.2.7 TRISYCL_MAKE_BOOST_CIRCULARBUFFER_THREAD_SAFE

```
#define TRISYCL_MAKE_BOOST_CIRCULARBUFFER_THREAD_SAFE
```

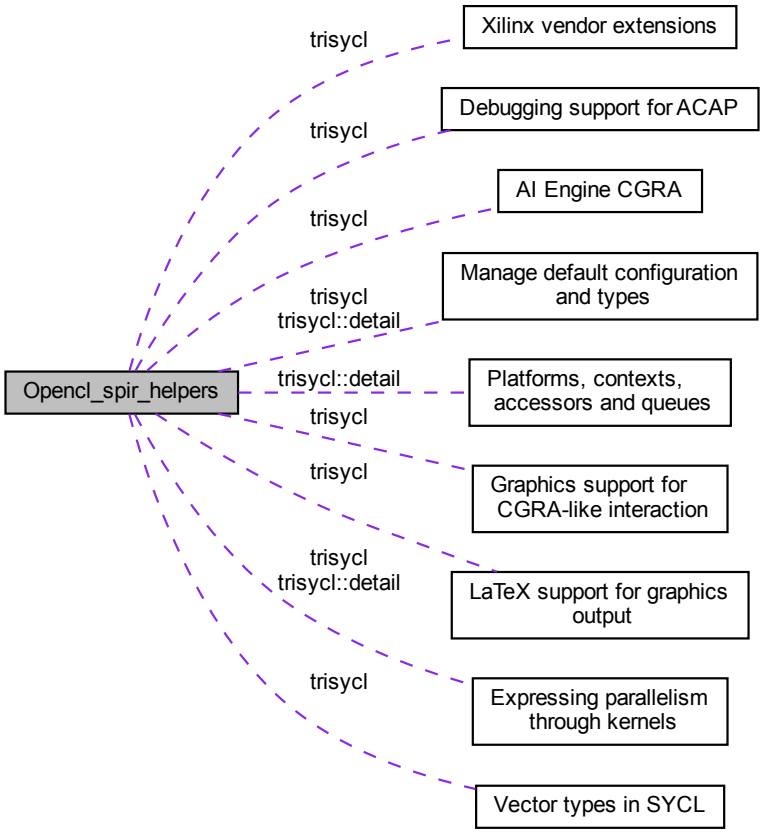
```
#include <include/triSYCL/detail/global_config.hpp>
```

Definition at line 65 of file global_config.hpp.

9.15.2.8 TRISYCL_OPENCL_ONLY

```
#define TRISYCL_OPENCL_ONLY(
              ... ) __VA_ARGS__
```

```
#include <include/triSYCL/detail/global_config.hpp>
```



Define TRISYCL_OPENCL to add OpenCL.

triSYCL can indeed work without OpenCL if only host support is needed. A macro to keep some stuff in OpenCL mode

Definition at line 84 of file global_config.hpp.

9.16 Opencl_spir_helpers

Collaboration diagram for Opencl_spir_helpers:

Namespaces

- namespace trisycl

  The vector type to be used as SYCL vector.

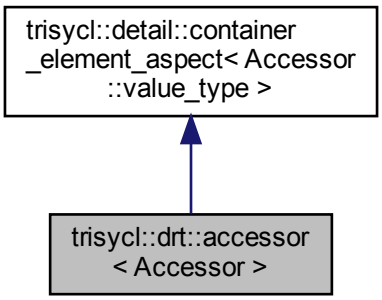
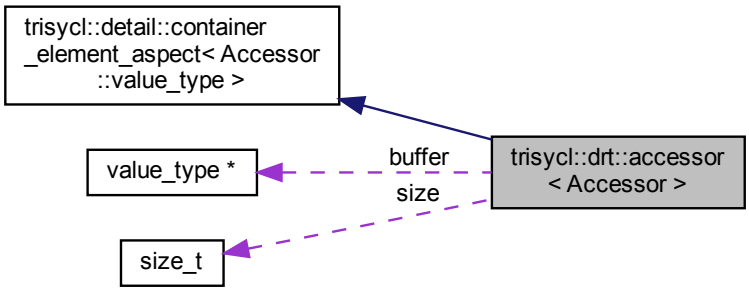
9.17.1 Detailed Description

9.17.2 Class Documentation



9.17.2.1 class trisycl::drt::accessor

template<typename Accessor>
class trisycl::drt::accessor< Accessor >



SYCL accessor seen from a device perspective.

Definition at line 49 of file device_runtime.hpp.

Inheritance diagram for trisycl::drt::accessor< Accessor >:

Collaboration diagram for trisycl::drt::accessor< Accessor >:

Public Member Functions

- accessor (Accessor &a)

  Capture the minimal accessor features.
- auto & operator[ ] (std::size_t index) const noexcept

  use the accessor with integers à la []

Private Attributes

- TRISYCL_GLOBAL_AS Accessor::value_type * buffer

  The pointer to the data.
- std::size_t size

  The size of the accessor.

Additional Inherited Members

9.17.2.1.1 Constructor & Destructor Documentation

9.17.2.1.1.1 accessor() template<typename Accessor >

```
trisycl::drt::accessor< Accessor >::accessor (
            Accessor & a )  [inline]
```

Capture the minimal accessor features.

Definition at line 73 of file device_runtime.hpp.

```
00073                         :
00074     /* Initialize the buffer with actually a \c cl_mem since it will be
00075 overridden with the kernel argument by the serializer at
00076 run-time, but at least from the kernel point of view it has to
00077 look like an \c Accessor::value_type * for the kernel
00078 outlining */
00079     buffer {
00080       reinterpret_cast<TRISYCL_GLOBAL_AS typename Accessor::value_type *>
00081         (a.implementation->get_order())
00082         },
00083     size { a.get_count() }
00084   {
00085 #ifndef TRISYCL_DEVICE
00086     /* Register the buffer address to be updated with the final
00087 version before the kernel set arg */
00088     TRISYCL_DUMP_T("drt::accessor(Accessor &a) :  &a = "
00089                    « (void *) &a « '\n'
00090                    « "\t&buffer = " « (void *) &buffer
00091                    « ", Order = " « a.implementation->get_order());
00092 #endif
00093   }
```

References a, and TRISYCL_DUMP_T.

9.17.2.1.2 Member Function Documentation

9.17.2.1.2.1 operator[]() template<typename Accessor >

```
auto & trisycl::drt::accessor< Accessor >::operator[ ] (
            std::size_t index ) const  [inline], [noexcept]
```

use the accessor with integers à la []

Definition at line 97 of file device_runtime.hpp.

```
00097                                                 {
00098     return buffer[index];
00099   }
```

9.17.2.1.3 Member Data Documentation

9.17.2.1.3.1 buffer template<typename Accessor >

```
TRISYCL_GLOBAL_AS Accessor::value_type* trisycl::drt::accessor< Accessor >::buffer  [private]
```

The pointer to the data.

For now none of the following works yet for various reasons:

```
 trisycl::global_ptr<typename Accessor::value_type> buffer;
 trisycl::global<typename Accessor::value_type *> buffer;
__global typename Accessor::pointer buffer;
```

So use a more trivial approach

Definition at line 63 of file device_runtime.hpp.

9.17.2.1.3.2 size template<typename Accessor >

```
std::size_t trisycl::drt::accessor< Accessor >::size  [private]
```

The size of the accessor.

The compiler should optimize it out if it is unused

Definition at line 68 of file device_runtime.hpp.

9.17.3 Function Documentation

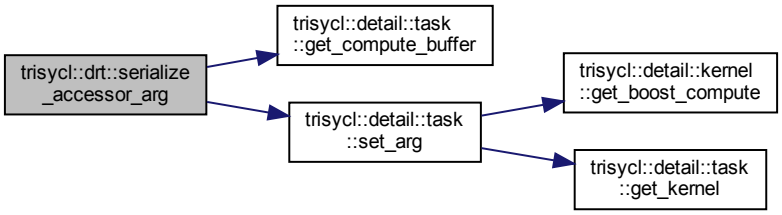
9.17.3.1 serialize_accessor_arg()

```
TRISYCL_WEAK_ATTRIB_PREFIX void TRISYCL_WEAK_ATTRIB_SUFFIX trisycl::drt::serialize_accessor_↩
arg (
            detail::task & task,
            std::size_t index,
            void * arg,
            std::size_t arg_size )
```

```
#include <include/triSYCL/device_runtime.hpp>
```

Set an accessor argument of the kernel.

Parameters



in	*task*	is the implementation detail of a triSYCL kernel
in	*index*	is the order of the argument to set (0 is the first one)
in	*arg*	points to the argument value
in	*arg_size*	is the size of the argument

Definition at line 136 of file device_runtime.hpp.

```
00139                                       {
00140   TRISYCL_DUMP_T("serialize_accessor_arg index = " « index
00141                  « ", size = " « arg_size « ", arg = " « arg);
00142 #ifdef TRISYCL_OPENCL
00143   /* The address of the argument has been actually initialized by the
00144 accessor constructor to the accessor order to relate an argument
00145 to its accessor */
00146   task.set_arg(index,
00147                task.get_compute_buffer(reinterpret_cast<std::size_t>(arg)));
00148 #endif
00149 }
```

References trisycl::detail::task::get_compute_buffer(), trisycl::detail::task::set_arg(), and TRISYCL_DUMP_T.

Here is the call graph for this function:

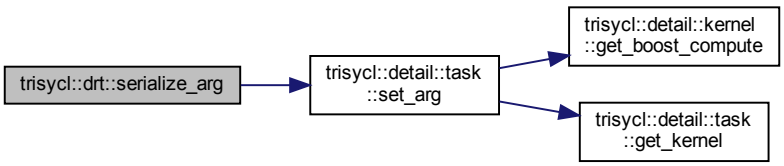
9.17.3.2 serialize_arg()

```
TRISYCL_WEAK_ATTRIB_PREFIX void TRISYCL_WEAK_ATTRIB_SUFFIX trisycl::drt::serialize_arg (
            detail::task & task,
            std::size_t index,
            void * arg,
            std::size_t arg_size )
```

```
#include <include/triSYCL/device_runtime.hpp>
```

Set an argument value of the kernel.

Parameters



in	*task*	is the implementation detail of a triSYCL kernel
in	*index*	is the order of the argument to set (0 is the first one)
in	*arg*	points to the argument value
in	*arg_size*	is the size of the argument

Definition at line 115 of file device_runtime.hpp.

```
00118                                       {
00119   TRISYCL_DUMP_T("serialize_arg index = " « index
00120                  « ", size = " « arg_size « ", arg = " « arg);
00121   task.set_arg(index, arg_size, arg);
00122 }
```

References trisycl::detail::task::set_arg(), and TRISYCL_DUMP_T.

Here is the call graph for this function:

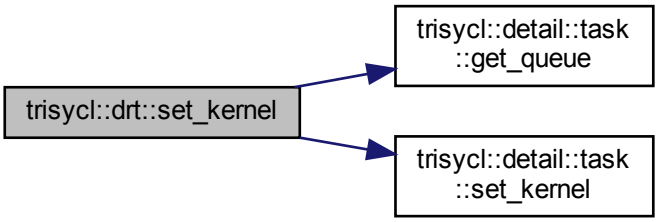
9.17.3.3 set_kernel()

```
TRISYCL_WEAK_ATTRIB_PREFIX void TRISYCL_WEAK_ATTRIB_SUFFIX trisycl::drt::set_kernel (
            detail::task & task,
            const char * kernel_name,
            const char * kernel_short_name )
```

`#include <include/triSYCL/device_runtime.hpp>`

Set the kernel for a later invocation.

Parameters



in	*task*	is the implementation detail of a triSYCL kernel
in	*kernel_name*	is set by the device compiler to identify the kernel to call

Definition at line 198 of file device_runtime.hpp.

```
00200                                   {
00201   TRISYCL_DUMP_T("set_kernel setting up " « kernel_name
00202                  « "\n\taka " « kernel_short_name);
00203   // \todo Add kernel caching per device
00204   // auto binary = kernel_IR.find(kernel_name);
00205   // if (binary == kernel_IR.end()) {
00206 #ifdef TRISYCL_OPENCL
00207   auto context = task.get_queue()->get_boost_compute().get_context();
00208   // Construct an OpenCL program from the precompiled kernel file
00209   auto program = boost::compute::program::create_with_binary
00210     (code::program::p->binary,
00211      code::program::p->binary_size,
00212      context);
00213   TRISYCL_DUMP_T("...on device with name "
00214                  « task.get_queue()->get_boost_compute().get_device().name());
00215   // Build the OpenCL program
00216   program.build();
00217
00218   // Build a SYCL kernel from the OpenCL kernel
00219   trisycl::kernel k { boost::compute::kernel { program, kernel_short_name } };
00220
00221   task.set_kernel(k.implementation);
00222 #endif
00223 }
```

References trisycl::detail::task::get_queue(), trisycl::drt::code::program::p, trisycl::detail::task::set_kernel(), and TRISYCL_DUMP_T.

Here is the call graph for this function:

9.17.4 Variable Documentation

9.17.4.1 kernel_IR

```
TRISYCL_WEAK_ATTRIB_PREFIX std::map<std::string, std::vector<unsigned char> > TRISYCL_WEAK_ATTRIB_SUFFIX
trisycl::drt::kernel_IR
```

```
#include <include/triSYCL/device_runtime.hpp>
```

The code of the kernels arranged by name.

Todo use std::byte when moving to C++17

Definition at line 187 of file device_runtime.hpp.

9.18 Error handling

Namespaces

- namespace trisycl::trisycl

Classes

- struct trisycl::error_handler

  User supplied error handler to call a user-provided function when an error happens from a SYCL object that was constructed with this error handler. More...
- struct trisycl::exception_list

  Exception list to store several exceptions. More...
- class trisycl::exception

  Encapsulate a SYCL error information. More...
- class trisycl::cl_exception

  Returns the OpenCL error code encapsulated in the exception. More...
- struct trisycl::async_exception

  An error stored in an exception_list for asynchronous errors. More...
- class trisycl::runtime_error
- class trisycl::kernel_error

  Error that occurred before or while enqueuing the SYCL kernel. More...
- class trisycl::accessor_error

  Error regarding the trisycl::accessor objects defined. More...
- class trisycl::nd_range_error

  Error regarding the trisycl::nd_range specified for the SYCL kernel. More...
- class trisycl::event_error

  Error regarding associated trisycl::event objects. More...
- class trisycl::invalid_parameter_error

  Error regarding parameters to the SYCL kernel, it may apply to any captured parameters to the kernel lambda. More...
- class trisycl::device_error

  The SYCL device will trigger this exception on error. More...
- class trisycl::compile_program_error

  Error while compiling the SYCL kernel to a SYCL device. More...
- class trisycl::link_program_error

  Error while linking the SYCL kernel to a SYCL device. More...
- class trisycl::invalid_object_error

  Error regarding any memory objects being used inside the kernel. More...
- class trisycl::memory_allocation_error

  Error on memory allocation on the SYCL device for a SYCL kernel. More...
- class trisycl::pipe_error

  A failing pipe error will trigger this exception on error. More...
- class trisycl::platform_error

  The SYCL platform will trigger this exception on error. More...
- class trisycl::profiling_error

  The SYCL runtime will trigger this error if there is an error when profiling info is enabled. More...
- class trisycl::feature_not_supported

  Exception thrown when an optional feature or extension is used in a kernel but its not available on the device the SYCL kernel is being enqueued on. More...
- class trisycl::non_cl_error

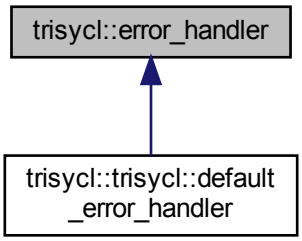
  Exception for an OpenCL operation requested in a non OpenCL area. More...

Typedefs

- using trisycl::exception_ptr = std::exception_ptr

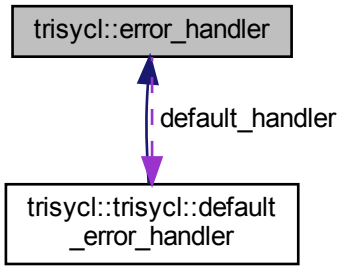
  A shared pointer to an exception as in C++ specification.
- using trisycl::async_handler = function_class< void, exception_list >

9.18.1 Detailed Description



9.18.2 Class Documentation

9.18.2.1 struct trisycl::error_handler



User supplied error handler to call a user-provided function when an error happens from a SYCL object that was constructed with this error handler.

Definition at line 31 of file error_handler.hpp.

Inheritance diagram for trisycl::error_handler:

Collaboration diagram for trisycl::error_handler:

Public Member Functions

- virtual void report_error (exception &error)=0

  The method to define to be called in the case of an error.
- virtual ~error_handler ()=0

Static Public Attributes

- static trisycl::default_error_handler default_handler

  Add a default_handler to be used by default.

9.18.2.1.1 Constructor & Destructor Documentation

9.18.2.1.1.1 ~error_handler() `virtual trisycl::error_handler::~error_handler ( ) [pure virtual]`

9.18.2.1.2 Member Function Documentation

9.18.2.1.2.1 report_error() `virtual void trisycl::error_handler::report_error ( exception & error ) [pure virtual]`

The method to define to be called in the case of an error.

Todo Add "virtual void" to the specification

Implemented in trisycl::trisycl::default_error_handler.

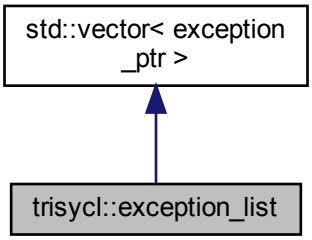
9.18.2.1.3 Member Data Documentation

9.18.2.1.3.1 default_handler `trisycl::default_error_handler trisycl::error_handler::default_handler [static]`

Add a default_handler to be used by default.

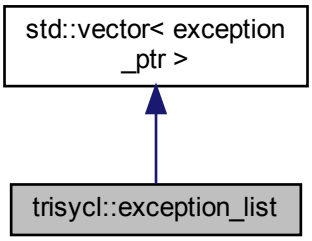
Todo add this concept to the specification?

Definition at line 42 of file error_handler.hpp.



9.18.2.2 struct trisycl::exception_list

Exception list to store several exceptions.

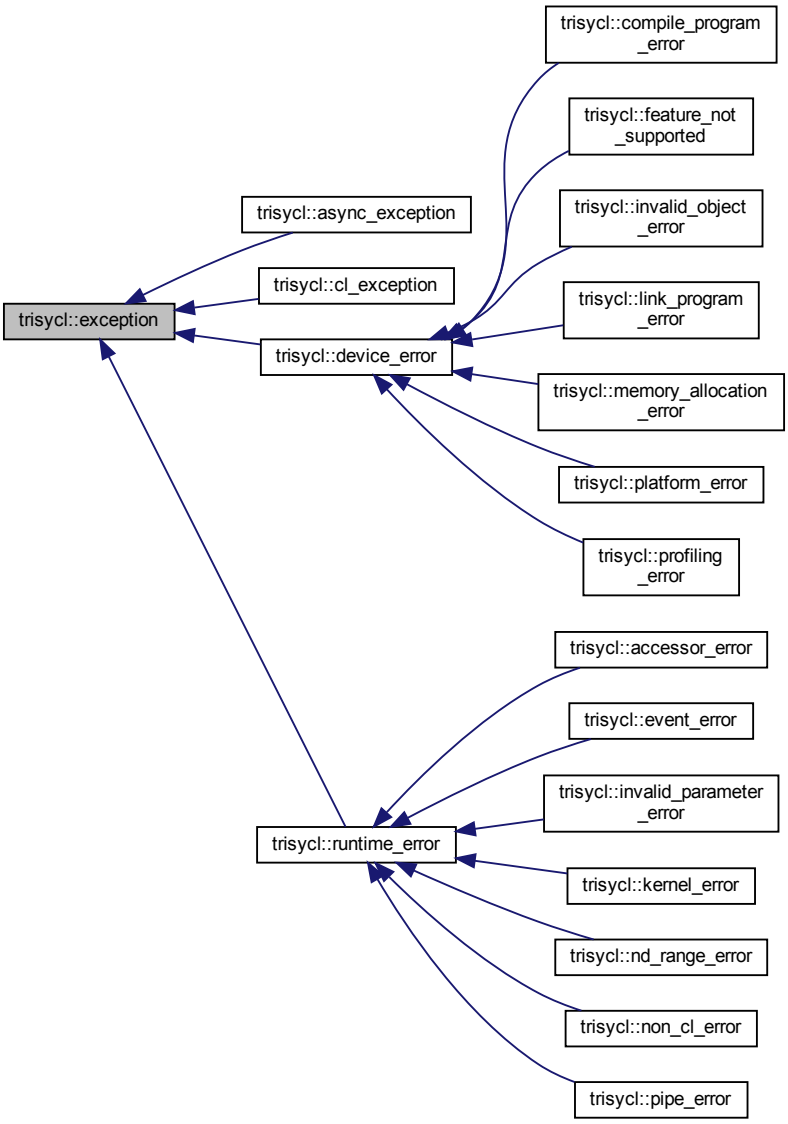


Todo Do we need to define it in SYCL or can we rely on plain C++17 one?

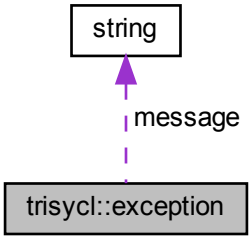
Definition at line 32 of file exception.hpp.

Inheritance diagram for trisycl::exception_list:

Collaboration diagram for trisycl::exception_list:



9.18.2.3 class trisycl::exception



Encapsulate a SYCL error information.

Definition at line 40 of file exception.hpp.

Inheritance diagram for trisycl::exception:

Collaboration diagram for trisycl::exception:

Public Member Functions

- exception (const string_class &message)

  Construct an exception with a message for internal use.
- string_class what () const

  Returns a descriptive string for the error, if available.

Private Attributes

- string_class message

  The error message to return.

9.18.2.3.1 Constructor & Destructor Documentation

9.18.2.3.1.1 exception() `trisycl::exception::exception ( const string_class & message ) [inline]`

Construct an exception with a message for internal use.

Definition at line 48 of file exception.hpp.

```
00048 :  message { message } {}
```

9.18.2.3.2 Member Function Documentation

9.18.2.3.2.1 what() `string_class trisycl::exception::what ( ) const [inline]`

Returns a descriptive string for the error, if available.

Definition at line 51 of file exception.hpp.

```
00051                              {
00052     return message;
00053   }
```

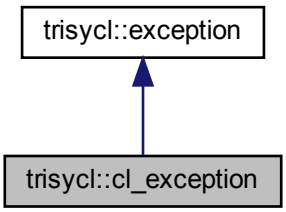
References message.

9.18.2.3.3 Member Data Documentation

9.18.2.3.3.1 message `string_class trisycl::exception::message [private]`

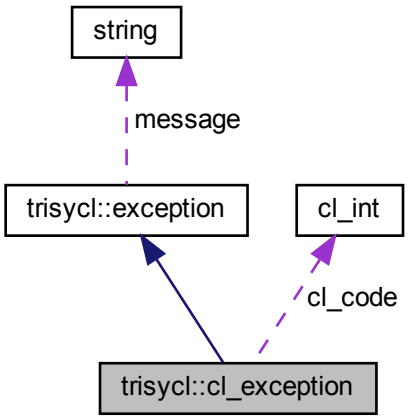
The error message to return.

Definition at line 43 of file exception.hpp.



Referenced by what().

9.18.2.4 class trisycl::cl_exception



Returns the OpenCL error code encapsulated in the exception.

Definition at line 68 of file exception.hpp.

Inheritance diagram for trisycl::cl_exception:

Collaboration diagram for trisycl::cl_exception:

Public Member Functions

- cl_exception (const string_class &message, cl_int cl_code)

  Construct an exception with a message and OpenCL error code for internal use.
- cl_int get_cl_code () const

Private Attributes

- cl_int cl_code

  The OpenCL error code to return.

9.18.2.4.1 Constructor & Destructor Documentation

9.18.2.4.1.1 cl_exception() `trisycl::cl_exception::cl_exception ( const string_class & message, cl_int cl_code ) [inline]`

Construct an exception with a message and OpenCL error code for internal use.

Definition at line 79 of file exception.hpp.

```
00080     :  exception { message }, cl_code { cl_code } {}
```

9.18.2.4.2 Member Function Documentation

9.18.2.4.2.1 get_cl_code() `cl_int trisycl::cl_exception::get_cl_code ( ) const [inline]`

Definition at line 83 of file exception.hpp.

```
00083                                {
00084     return cl_code;
00085   }
```

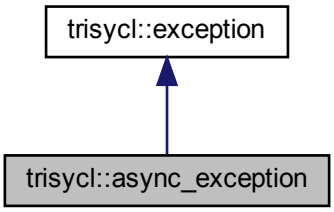
References cl_code.

9.18.2.4.3 Member Data Documentation

9.18.2.4.3.1 cl_code `cl_int trisycl::cl_exception::cl_code [private]`

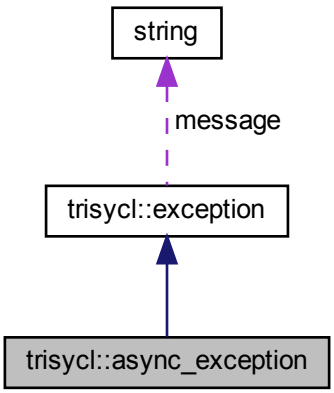
The OpenCL error code to return.

Definition at line 73 of file exception.hpp.



Referenced by get_cl_code().

9.18.2.5 struct trisycl::async_exception



An error stored in an exception_list for asynchronous errors.

Definition at line 92 of file exception.hpp.

Inheritance diagram for trisycl::async_exception:

Collaboration diagram for trisycl::async_exception:

Public Member Functions

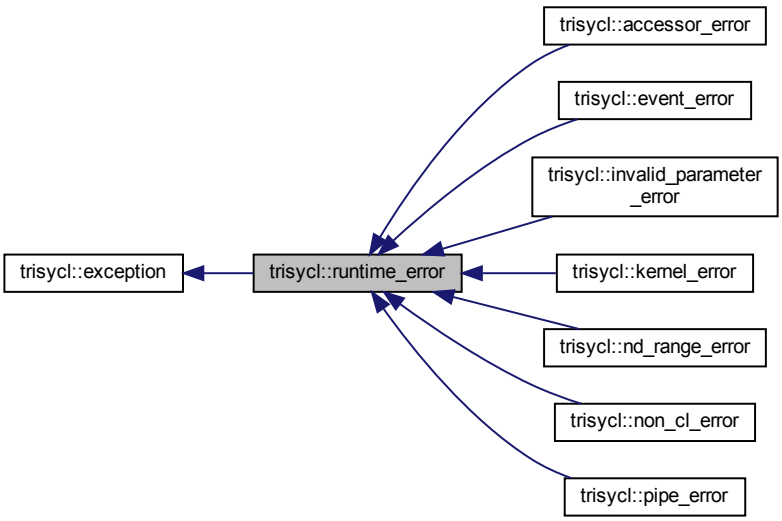
- exception (const string_class &message)

  Construct an exception with a message for internal use.

9.18.2.5.1 Member Function Documentation

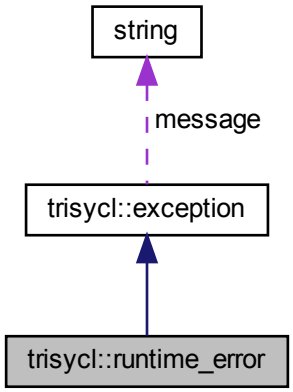
9.18.2.5.1.1 exception() `trisycl::exception::exception ( const string_class & message ) [inline]`

Construct an exception with a message for internal use.



Definition at line 48 of file exception.hpp.

```
00048 :  message { message } {}
```



9.18.2.6 class trisycl::runtime_error

Definition at line 97 of file exception.hpp.

Inheritance diagram for trisycl::runtime_error:

Collaboration diagram for trisycl::runtime_error:

Private Member Functions

- exception (const string_class &message)

  Construct an exception with a message for internal use.

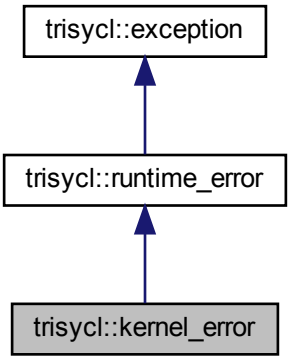
Additional Inherited Members

9.18.2.6.1 Member Function Documentation

9.18.2.6.1.1 exception() `trisycl::exception::exception (const string_class & message ) [inline], [private]`

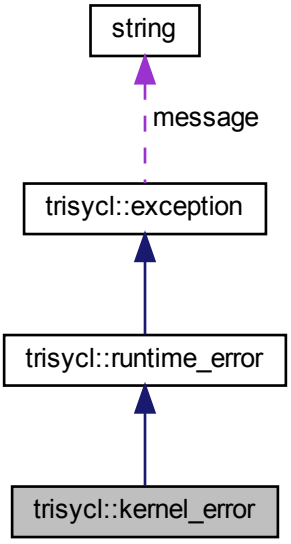
Construct an exception with a message for internal use.

Definition at line 48 of file exception.hpp.



```
00048 : message { message } {}
```

9.18.2.7 class trisycl::kernel_error

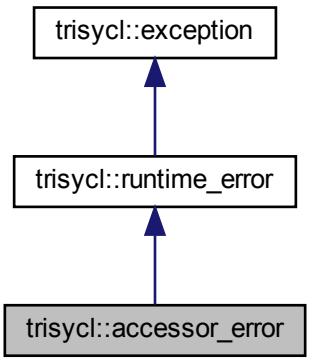


Error that occurred before or while enqueuing the SYCL kernel.

Definition at line 103 of file exception.hpp.

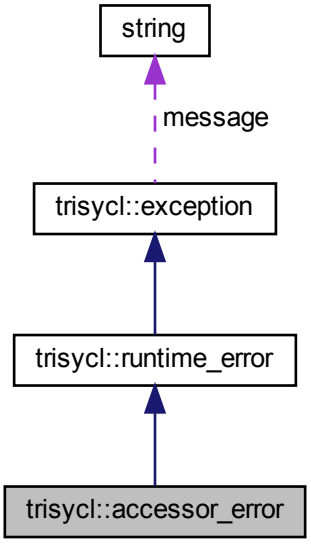
Inheritance diagram for trisycl::kernel_error:

Collaboration diagram for trisycl::kernel_error:



Additional Inherited Members

9.18.2.8 class trisycl::accessor_error

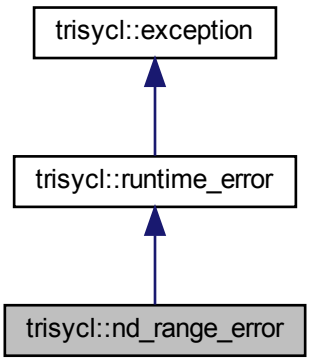


Error regarding the trisycl::accessor objects defined.

Definition at line 109 of file exception.hpp.

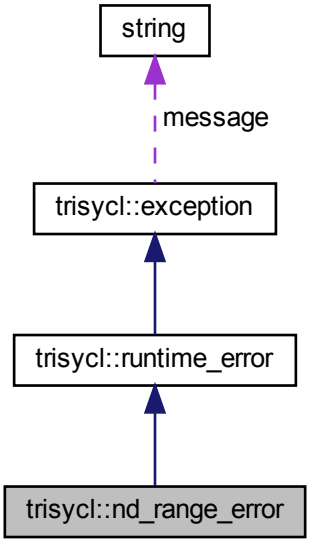
Inheritance diagram for trisycl::accessor_error:

Collaboration diagram for trisycl::accessor_error:



Additional Inherited Members

9.18.2.9 class trisycl::nd_range_error

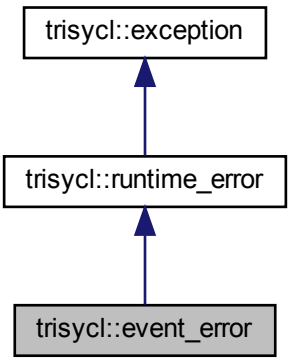


Error regarding the trisycl::nd_range specified for the SYCL kernel.

Definition at line 115 of file exception.hpp.

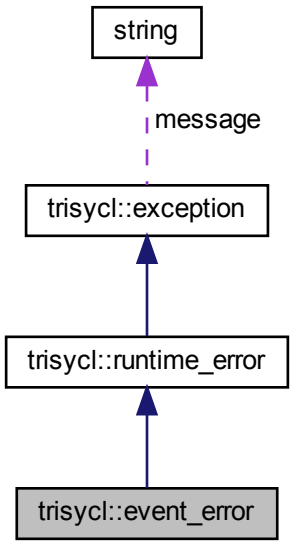
Inheritance diagram for trisycl::nd_range_error:

Collaboration diagram for trisycl::nd_range_error:



Additional Inherited Members

9.18.2.10 class trisycl::event_error

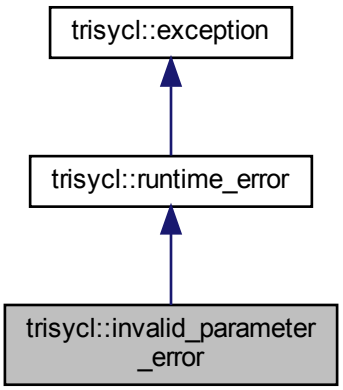


Error regarding associated trisycl::event objects.

Definition at line 121 of file exception.hpp.

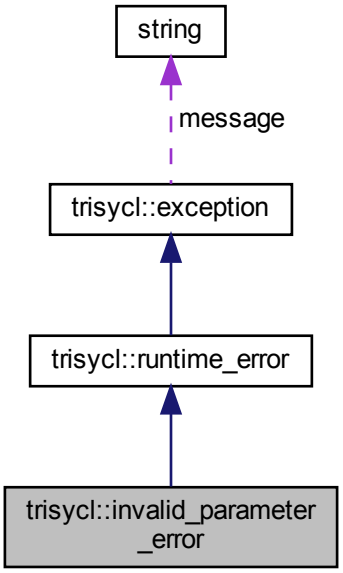
Inheritance diagram for trisycl::event_error:

Collaboration diagram for trisycl::event_error:



Additional Inherited Members

9.18.2.11 class trisycl::invalid_parameter_error

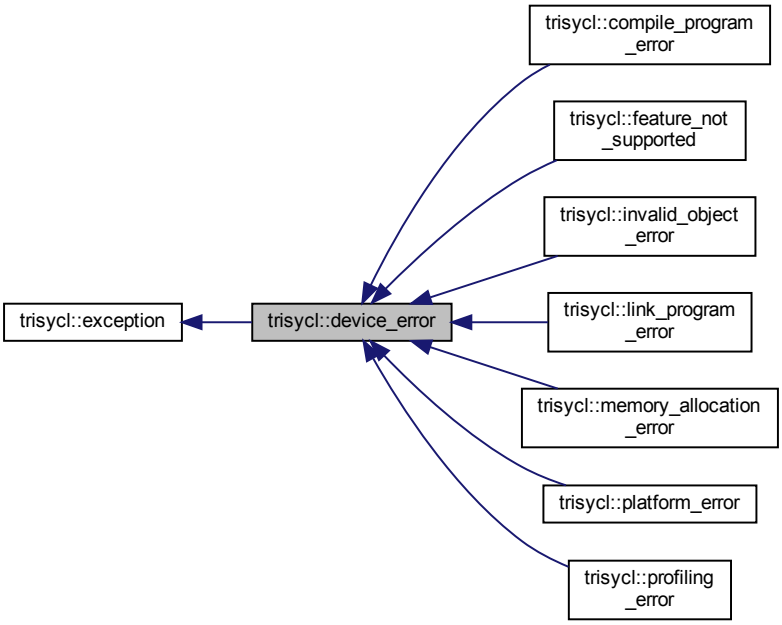


Error regarding parameters to the SYCL kernel, it may apply to any captured parameters to the kernel lambda.

Definition at line 129 of file exception.hpp.

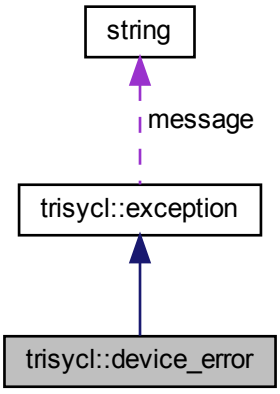
Inheritance diagram for trisycl::invalid_parameter_error:

Collaboration diagram for trisycl::invalid_parameter_error:



Additional Inherited Members

9.18.2.12 class trisycl::device_error



The SYCL device will trigger this exception on error.

Definition at line 135 of file exception.hpp.

Inheritance diagram for trisycl::device_error:

Collaboration diagram for trisycl::device_error:

Private Member Functions

- exception (const string_class &message)

  Construct an exception with a message for internal use.

Additional Inherited Members

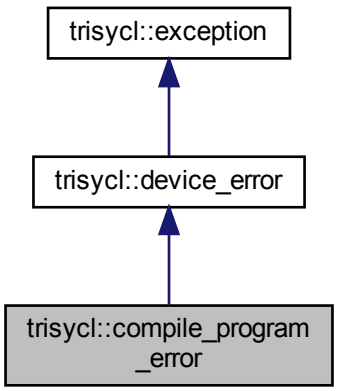
9.18.2.12.1 Member Function Documentation

9.18.2.12.1.1 exception() `trisycl::exception::exception (`

`const string_class & message ) [inline], [private]`

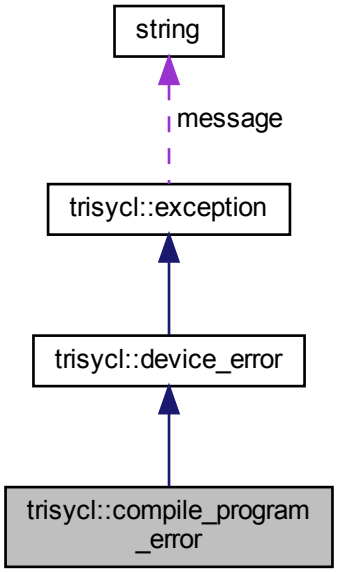
Construct an exception with a message for internal use.

Definition at line 48 of file exception.hpp.



```
00048 :  message { message } {}
```

9.18.2.13 class trisycl::compile_program_error

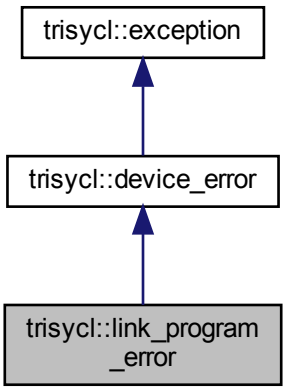


Error while compiling the SYCL kernel to a SYCL device.

Definition at line 141 of file exception.hpp.

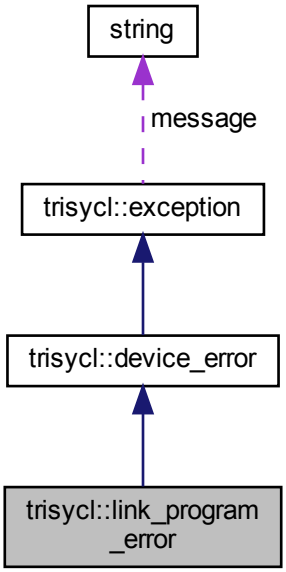
Inheritance diagram for trisycl::compile_program_error:

Collaboration diagram for trisycl::compile_program_error:



Additional Inherited Members

9.18.2.14 class trisycl::link_program_error

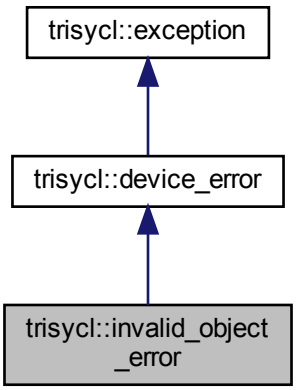


Error while linking the SYCL kernel to a SYCL device.

Definition at line 147 of file exception.hpp.

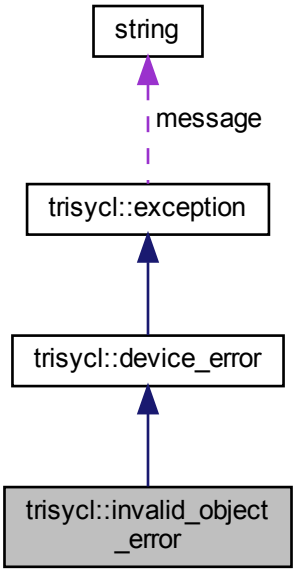
Inheritance diagram for trisycl::link_program_error:

Collaboration diagram for trisycl::link_program_error:



Additional Inherited Members

9.18.2.15 class trisycl::invalid_object_error

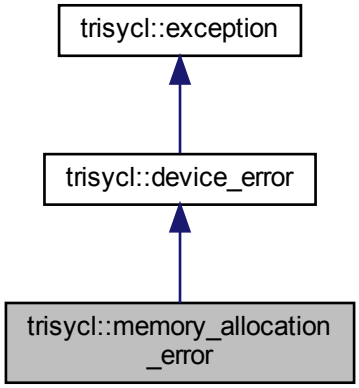


Error regarding any memory objects being used inside the kernel.

Definition at line 153 of file exception.hpp.

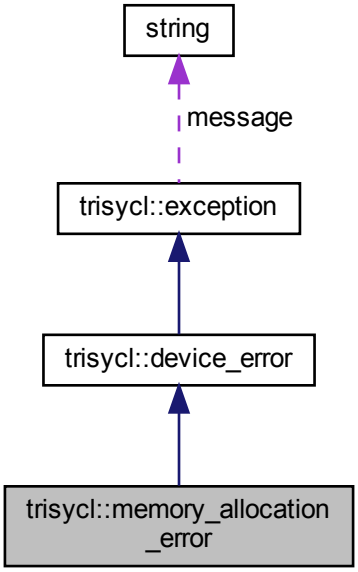
Inheritance diagram for trisycl::invalid_object_error:

Collaboration diagram for trisycl::invalid_object_error:



Additional Inherited Members

9.18.2.16 class trisycl::memory_allocation_error

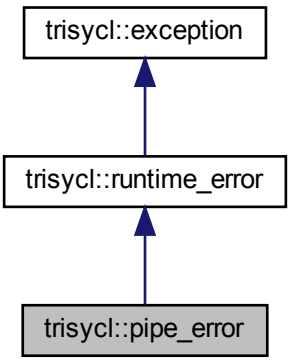


Error on memory allocation on the SYCL device for a SYCL kernel.

Definition at line 159 of file exception.hpp.

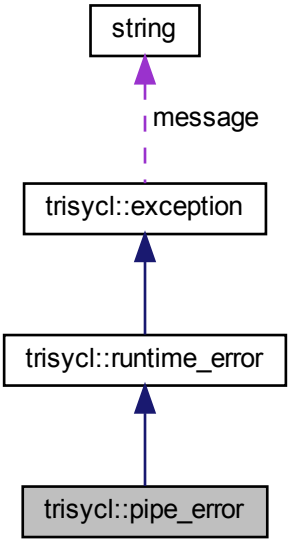
Inheritance diagram for trisycl::memory_allocation_error:

Collaboration diagram for trisycl::memory_allocation_error:



Additional Inherited Members

9.18.2.17 class trisycl::pipe_error

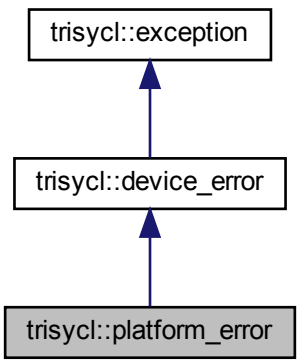


A failing pipe error will trigger this exception on error.

Definition at line 165 of file exception.hpp.

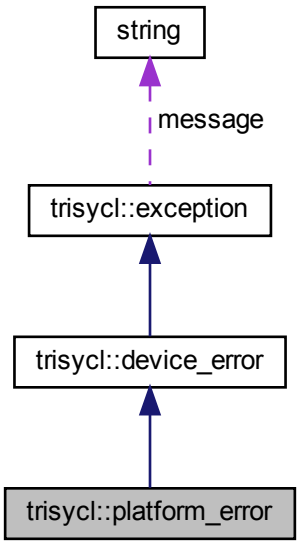
Inheritance diagram for trisycl::pipe_error:

Collaboration diagram for trisycl::pipe_error:



Additional Inherited Members

9.18.2.18 class trisycl::platform_error

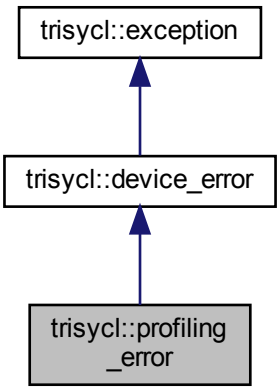


The SYCL platform will trigger this exception on error.

Definition at line 171 of file exception.hpp.

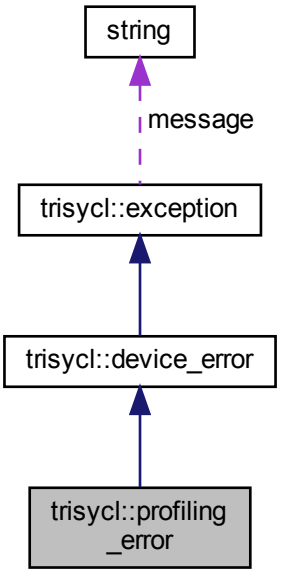
Inheritance diagram for trisycl::platform_error:

Collaboration diagram for trisycl::platform_error:



Additional Inherited Members

9.18.2.19 class trisycl::profiling_error

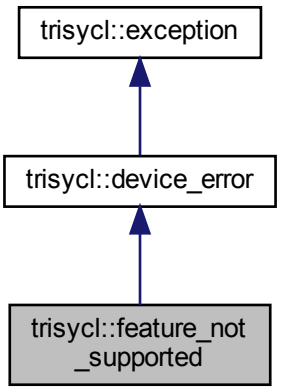


The SYCL runtime will trigger this error if there is an error when profiling info is enabled.

Definition at line 179 of file exception.hpp.

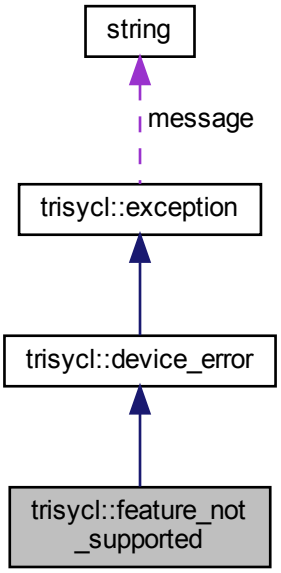
Inheritance diagram for trisycl::profiling_error:

Collaboration diagram for trisycl::profiling_error:



Additional Inherited Members

9.18.2.20 class trisycl::feature_not_supported



Exception thrown when an optional feature or extension is used in a kernel but its not available on the device the SYCL kernel is being enqueued on.

Definition at line 188 of file exception.hpp.

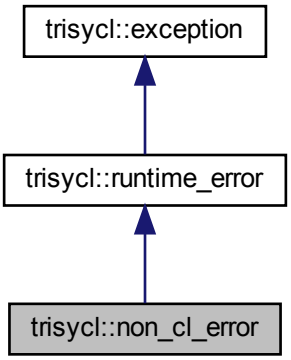
Inheritance diagram for trisycl::feature_not_supported:

Collaboration diagram for trisycl::feature_not_supported:

Additional Inherited Members

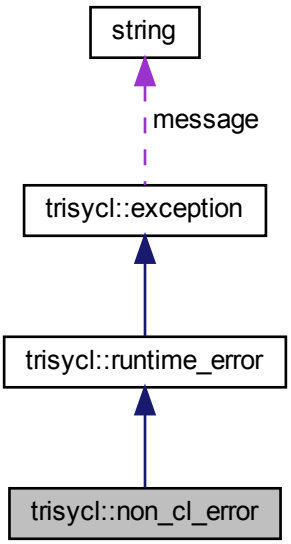
9.18.2.21 class trisycl::non_cl_error

Exception for an OpenCL operation requested in a non OpenCL area.



Todo Add to the specification

Todo Clean implementation



Todo Exceptions are named error in C++

Definition at line 201 of file exception.hpp.

Inheritance diagram for trisycl::non_cl_error:

Collaboration diagram for trisycl::non_cl_error:

9.18.3 Typedef Documentation

9.18.3.1 async_handler

```
using trisycl::async_handler = typedef function_class<void, exception_list>
```

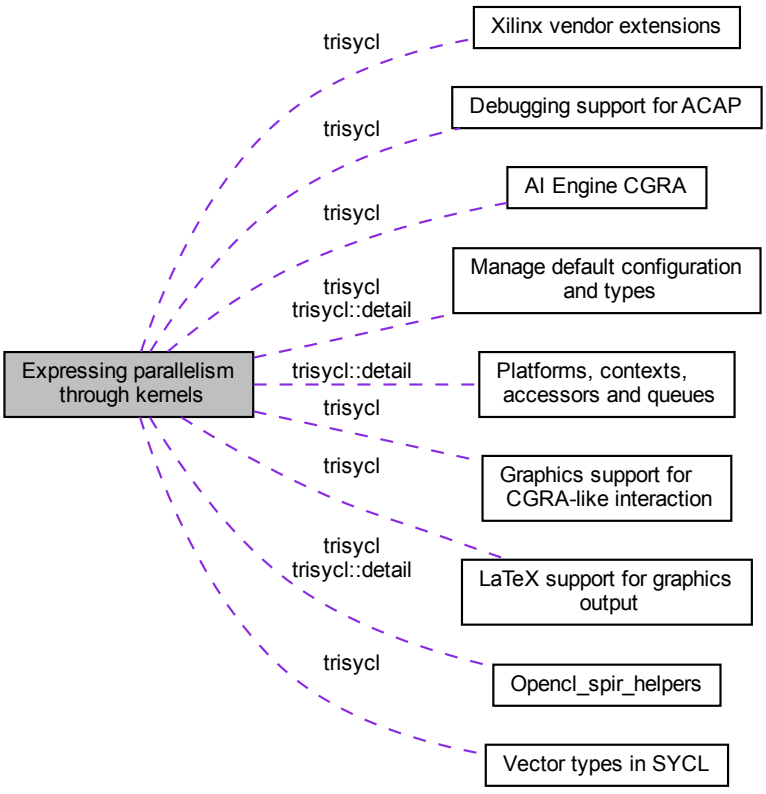
```
#include <include/triSYCL/exception.hpp>
```

Definition at line 36 of file exception.hpp.

9.18.3.2 exception_ptr

```
using trisycl::exception_ptr = typedef std::exception_ptr
```

```
#include <include/triSYCL/exception.hpp>
```



A shared pointer to an exception as in C++ specification.

Todo Do we need this instead of reusing directly the one from C++11?

Definition at line 25 of file exception.hpp.

9.19 Expressing parallelism through kernels

Collaboration diagram for Expressing parallelism through kernels:

Namespaces

- namespace trisycl

  The vector type to be used as SYCL vector.
- namespace trisycl::detail

  Some global triSYCL configuration.

Classes

- struct trisycl::group< Dimensions >

  A group index used in a parallel_for_workitem to specify a work_group. More...
- struct trisycl::h_item< Dimensions >

  `h_item<int dimensions>` identifies an instance of a `group::parallel_for_work_item` function object executing at each point in a local `range<int dimensions>` passed to a `parallel_for_work_item` call or to the corresponding `parallel_for_work_group` call if no range is passed to the `parallel_for_work_item` call. More...
- class trisycl::id< Dimensions >

  Define a multi-dimensional index, used for example to locate a work item. More...
- class trisycl::item< Dimensions, with_offset >

  A SYCL item stores information on a work-item with some more context such as the definition range and offset. More...
- struct trisycl::nd_item< Dimensions >

  A SYCL nd_item stores information on a work-item within a work-group, with some more context such as the definition ranges. More...
- struct trisycl::nd_range< Dimensions >

  A ND-range, made by a global and local range, to specify work-group and work-item organization. More...
- struct trisycl::detail::parallel_for_iterate< level, Range, ParallelForFunctor, Id >

  A recursive multi-dimensional iterator that ends up calling f. More...
- struct trisycl::detail::parallel_for_iterate< 0, Range, ParallelForFunctor, Id >

  Stop the recursion when level reaches 0 by simply calling the kernel functor with the constructed id. More...
- class trisycl::range< Dimensions >

  A SYCL range defines a multi-dimensional index range that can be used to define launch parallel computation extent or buffer sizes. More...

Functions

- template<typename... BasicType>
  trisycl::id (BasicType... Args) -> id< sizeof...(Args)>

  User-defined deduction guides to deduce the rank of an id from the number of arguments.
- template<int Dimensions = 1, typename ParallelForFunctor , typename Id >
  void trisycl::detail::parallel_for (range< Dimensions > r, ParallelForFunctor f, Id)

  Implementation of a data parallel computation with parallelism specified at launch time by a range<>.
- template<int Dimensions = 1, typename ParallelForFunctor >
  void trisycl::detail::parallel_for (range< Dimensions > r, ParallelForFunctor f, item< Dimensions >)

  Implementation of a data parallel computation with parallelism specified at launch time by a range<>.
- template<typename F , typename R , typename A >
  auto trisycl::detail::capture_arg_v (R(F::*)(A))
- template<int Dimensions = 1, typename ParallelForFunctor >
  void trisycl::detail::parallel_for (range< Dimensions > r, ParallelForFunctor f)

  Calls the appropriate ternary parallel_for overload based on the index type of the kernel function object f.

- template<int Dimensions = 1, typename ParallelForFunctor >
  void trisycl::detail::parallel_for_global_offset (range< Dimensions > global_size, id< Dimensions > offset, ParallelForFunctor f)

  Implementation of parallel_for with a range<> and an offset.
- template<int Dimensions = 1, typename ParallelForFunctor >
  void trisycl::detail::parallel_for_workgroup (nd_range< Dimensions > r, ParallelForFunctor f)

  Implement the loop on the work-groups.
- template<int Dimensions, typename T_Item , typename ParallelForFunctor >
  void trisycl::detail::parallel_for_workitem (const group< Dimensions > &g, ParallelForFunctor f)

  Implement the loop on the work-items inside a work-group.
- template<int Dimensions = 1, typename ParallelForFunctor >
  void trisycl::detail::parallel_for (nd_range< Dimensions > r, ParallelForFunctor f)

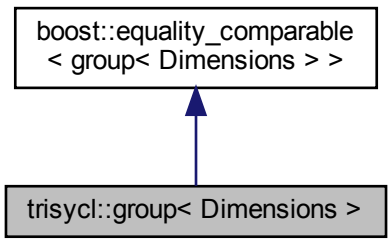
  Implement a variation of parallel_for to take into account a nd_range<>
- template<int Dimensions = 1, typename ParallelForFunctor >
  void trisycl::detail::parallel_for_workitem_in_group (const group< Dimensions > &g, ParallelForFunctor f)

  Implement the loop on the work-items inside a work-group.
- static auto trisycl::detail::to_tbb_range (const range< 1 > &r)
- static auto trisycl::detail::to_tbb_range (const range< 2 > &r)
- static auto trisycl::detail::to_tbb_range (const range< 3 > &r)
- static auto trisycl::detail::to_sycl_id (const tbb::blocked_range< size_t > &in)
- static auto trisycl::detail::to_sycl_id (const tbb::blocked_range2d< size_t > &in)
- static auto trisycl::detail::to_sycl_id (const tbb::blocked_range3d< size_t > &in)
- template<typename Range , typename ParallelForFunctor >
  void trisycl::detail::parallel_for_iterate (Range r, ParallelForFunctor &f)
- template<typename... BasicType>
  trisycl::range (BasicType... Args) -> range< sizeof...(Args)>

  User-defined deduction guides to deduce the rank of a range from the number of arguments.

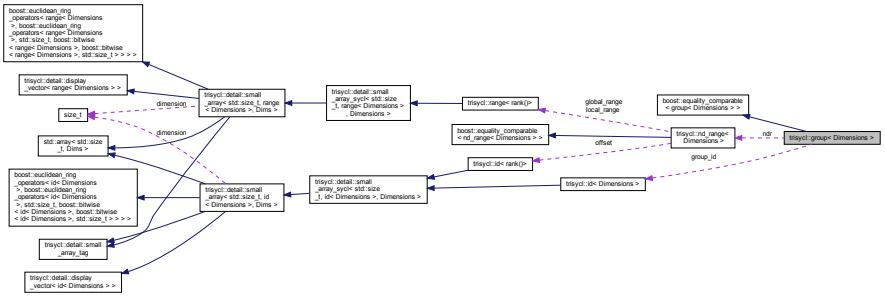
9.19.1 Detailed Description

9.19.2 Class Documentation



9.19.2.1 struct trisycl::group

template<int Dimensions>
struct trisycl::group< Dimensions >



A group index used in a parallel_for_workitem to specify a work_group.

Definition at line 41 of file group.hpp.

Inheritance diagram for trisycl::group< Dimensions >:

Collaboration diagram for trisycl::group< Dimensions >:

Public Member Functions

- group (const nd_range< Dimensions > &ndr)

  Create a group from an nd_range<> with a 0 id<>
- group (const id< Dimensions > &i, const nd_range< Dimensions > &ndr)

  Create a group from an id and a nd_range<>
- group ()=default

  To be able to copy and assign group, use default constructors too.
- id< Dimensions > get_id () const

  Return an id representing the index of the group within the nd_range for every dimension.
- size_t get_id (int dimension) const

  Return the index of the group in the given dimension.
- auto & operator[ ] (int dimension)

  Return the index of the group in the given dimension within the nd_range<>
- range< Dimensions > get_group_range () const

  Return a range<> representing the dimensions of the current group.
- size_t get_group_range (int dimension) const

  Return element dimension from the con stituent group range.
- range< Dimensions > get_global_range () const

  Get the local range for this work_group.
- size_t get_global_range (int dimension) const

  Return element dimension from the constituent global range.
- range< Dimensions > get_local_range () const

  Get the local range for this work_group.
- size_t get_local_range (int dimension) const

  Return element dimension from the constituent local range.
- id< Dimensions > get_offset () const

  Get the offset of the NDRange.
- size_t get_offset (int dimension) const

  Get the offset of the NDRange.
- nd_range< Dimensions > get_nd_range () const
- size_t get_linear_id () const

  Get a linearized version of the group ID.
- void parallel_for_work_item (std::function< void(h_item< rank()>)> f) const

  Loop on the work-items inside a work-group.
- bool operator== (const group &groupB) const

Static Public Member Functions

- static auto constexpr rank ()

  The number of dimensions of the group.

Private Attributes

- id< Dimensions > group_id

  The coordinate of the group item.
- nd_range< Dimensions > ndr

  Keep a reference on the nd_range to serve potential query on it.

9.19.2.1.1 Constructor & Destructor Documentation

9.19.2.1.1.1 group() [1/3] template<int Dimensions>

```
trisycl::group< Dimensions >::group (
            const nd_range< Dimensions > & ndr )  [inline]
```

Create a group from an nd_range<> with a 0 id<>

Todo This should be private since it is only used by the triSYCL implementation

Definition at line 60 of file group.hpp.

```
00060 :  ndr { ndr } {}
```

9.19.2.1.1.2 group() [2/3] template<int Dimensions>

```
trisycl::group< Dimensions >::group (
            const id< Dimensions > & i,
            const nd_range< Dimensions > & ndr )  [inline]
```

Create a group from an id and a nd_range<>

Todo This should be private somehow, but it is used by the validation infrastructure

Definition at line 68 of file group.hpp.

```
00068                                                                 :
00069     group_id { i }, ndr { ndr } {}
```

9.19.2.1.1.3 group() [3/3] template<int Dimensions>

```
trisycl::group< Dimensions >::group ( )  [default]
```

To be able to copy and assign group, use default constructors too.

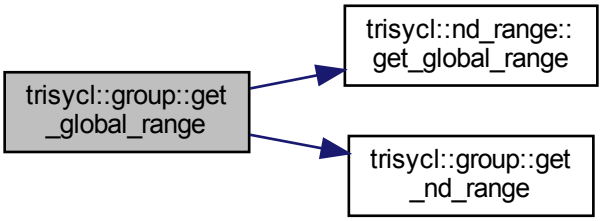
Todo Make most of them protected, reserved to implementation

9.19.2.1.2 Member Function Documentation

9.19.2.1.2.1 get_global_range() [1/2] template<int Dimensions>

range< Dimensions > trisycl::group< Dimensions >::get_global_range ( ) const [inline]

Get the local range for this work_group.



Definition at line 121 of file group.hpp.

```
00121                                                {
00122     return get_nd_range().get_global_range();
00123   }
```

References trisycl::nd_range< Dimensions >::get_global_range(), and trisycl::group< Dimensions >::get_nd_range().

Referenced by trisycl::group< Dimensions >::get_global_range().

Here is the call graph for this function:

Here is the caller graph for this function:

9.19.2.1.2.2 get_global_range() [2/2] template<int Dimensions>

```
size_t trisycl::group< Dimensions >::get_global_range (
            int dimension ) const  [inline]
```

Return element dimension from the constituent global range.

Definition at line 127 of file group.hpp.

```
00127                                          {
00128     return get_global_range()[dimension];
00129   }
```

References trisycl::group< Dimensions >::get_global_range().

Here is the call graph for this function:

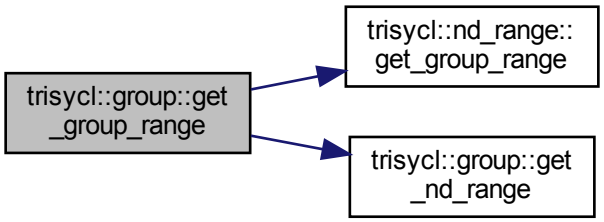
9.19.2.1.2.3 get_group_range() [1/2] template<int Dimensions>

```
range< Dimensions > trisycl::group< Dimensions >::get_group_range ( ) const  [inline]
```

Return a range<> representing the dimensions of the current group.

This local range may have been provided by the programmer, or chosen by the runtime.

Todo Fix this comment and the specification



Definition at line 109 of file group.hpp.

```
00109                                        {

9.19.2.1.2.16 rank() template<int Dimensions>

```
static auto constexpr trisycl::group< Dimensions >::rank ( )  [inline], [static], [constexpr]
```

The number of dimensions of the group.

Definition at line 43 of file group.hpp.

```
00043 { return Dimensions; }
```

9.19.2.1.3 Member Data Documentation

9.19.2.1.3.1 group_id template<int Dimensions>

```
id<Dimensions> trisycl::group< Dimensions >::group_id  [private]
```

The coordinate of the group item.

Definition at line 48 of file group.hpp.

Referenced by trisycl::group< Dimensions >::get_id(), trisycl::group< Dimensions >::operator==(), and trisycl::group< Dimensions >::operator[]().

9.19.2.1.3.2 ndr template<int Dimensions>

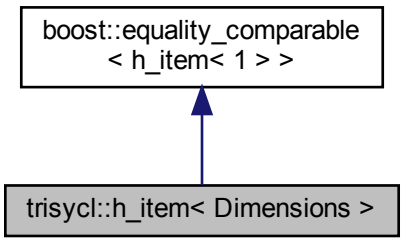
nd_range<Dimensions> trisycl::group< Dimensions >::ndr [private]

Keep a reference on the nd_range to serve potential query on it.

Definition at line 51 of file group.hpp.

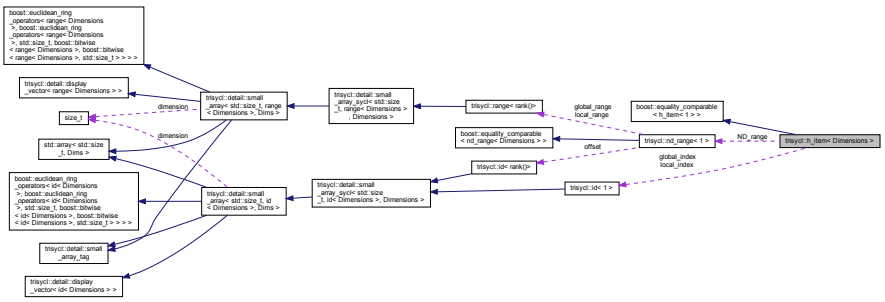
Referenced by trisycl::group< Dimensions >::get_nd_range(), and trisycl::group< Dimensions >::operator==().

9.19.2.2 struct trisycl::h_item



template<int Dimensions = 1>
struct trisycl::h_item< Dimensions >

`h_item<int dimensions>` identifies an instance of a `group::parallel_for_work_item` function object executing at each point in a local `range<int dimensions>` passed to a `parallel_for_work_item` call or to the corresponding `parallel_for_work_group` call if no range is passed to the `parallel_for_work_item` call.



It encapsulates enough information to identify the work-item's local and global items according to the information given to `parallel_for_work_group` (physical ids) as well as the work-item's logical local items in the flexible range. All returned items objects are offset-less. Instances of the `h_item<int dimensions>` class are not user-constructible and are passed by the runtime to each instance of the function object.

Definition at line 42 of file h_item.hpp.

Inheritance diagram for trisycl::h_item< Dimensions >:

Collaboration diagram for trisycl::h_item< Dimensions >:

Public Member Functions

- h_item (nd_range< Dimensions > ndr)

  Create an empty nd_item<> from an nd_range<>
- h_item (id< Dimensions > global_index, nd_range< Dimensions > ndr)

  Create a full nd_item.
- h_item ()=default

  To be able to copy and assign nd_item, use default constructors too.
- id< Dimensions > get_global_id () const

  Return the constituent global id representing the work-item's position in the global iteration space.
- size_t get_global_id (int dimension) const

  Return the constituent element of the global id representing the work-item's position in the global iteration space in the given dimension.
- size_t get_global_linear_id () const

  Return the flattened id of the current work-item after subtracting the offset.
- id< Dimensions > get_local_id () const

  Return the constituent local id representing the work-item's position within the current work-group.
- size_t get_local_id (int dimension) const

  Return the constituent element of the local id representing the work-item's position within the current work-group in the given dimension.
- size_t get_local_linear_id () const

  Return the flattened id of the current work-item within the current work-group.
- id< Dimensions > get_group () const

  Return the constituent group group representing the work-group's position within the overall nd_range.
- size_t get_group (int dimension) const

  Return the constituent element of the group id representing the work-group's position within the overall nd_range in the given dimension.
- size_t get_group_linear_id () const

  Return the flattened id of the current work-group.
- id< Dimensions > get_group_range () const

  Return the number of groups in the nd_range.
- size_t get_group_range (int dimension) const

  Return the number of groups for dimension in the nd_range.
- range< Dimensions > get_global_range () const

  Return a range<> representing the dimensions of the nd_range<>
- range< Dimensions > get_local_range () const

  Return a range<> representing the dimensions of the current work-group.
- id< Dimensions > get_offset () const

  Return an id<> representing the n-dimensional offset provided to the constructor of the nd_range<> and that is added by the runtime to the global-ID of each work-item.
- nd_range< Dimensions > get_nd_range () const

  Return the nd_range<> of the current execution.
- item< Dimensions > get_item () const

  Allows projection down to an item.
- void barrier (access::fence_space flag=access::fence_space::global_and_local) const

  Execute a barrier with memory ordering on the local address space, global address space or both based on the value of flag.
- void set_local (id< Dimensions > Index)
- void set_global (id< Dimensions > Index)
- bool operator== (const h_item< Dimensions > &itemB) const

  comparison operators

Static Public Member Functions

- static auto constexpr rank ()

  The number of dimensions of the h_item.

Private Attributes

- id< Dimensions > global_index
- id< Dimensions > local_index
- nd_range< Dimensions > ND_range

9.19.2.2.1 Constructor & Destructor Documentation

9.19.2.2.1.1 h_item() [1/3] template<int Dimensions = 1>

```
trisycl::h_item< Dimensions >::h_item (
            nd_range< Dimensions > ndr )  [inline]
```

Create an empty nd_item<> from an nd_range<>

Todo This is for the triSYCL implementation which is expected to call set_global() and set_local() later. This should be hidden to the user.

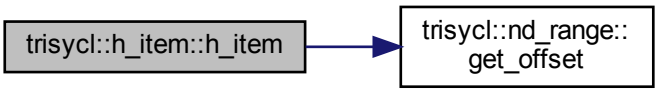
Definition at line 62 of file h_item.hpp.

```
00062 :  ND_range { ndr } {}
```

9.19.2.2.1.2 h_item() [2/3] template<int Dimensions = 1>

```
trisycl::h_item< Dimensions >::h_item (
            id< Dimensions > global_index,
            nd_range< Dimensions > ndr )  [inline]
```

Create a full nd_item.



Todo This is for validation purpose. Hide this to the programmer somehow

Definition at line 70 of file h_item.hpp.

```
00071                                    :
00072     global_index { global_index },
00073     // Compute the local index using the offset and the group size
00074     local_index
00075       { (global_index - ndr.get_offset())%id<Dimensions> { ndr.get_local() } },
00076     ND_range { ndr }
00077   {}
```

References trisycl::nd_range< Dimensions >::get_offset(), and trisycl::h_item< Dimensions >::global_index.

Here is the call graph for this function:

9.19.2.2.1.3 h_item() [3/3] template<int Dimensions = 1>

trisycl::h_item< Dimensions >::h_item ( ) [default]

To be able to copy and assign nd_item, use default constructors too.

Todo Make most of them protected, reserved to implementation

9.19.2.2.2 Member Function Documentation

9.19.2.2.2.1 barrier() template<int Dimensions = 1>

void trisycl::h_item< Dimensions >::barrier (
access::fence_space *flag* = *access::fence_space::global_and_local*) const [inline]

Execute a barrier with memory ordering on the local address space, global address space or both based on the value of flag.

The current work-item will wait at the barrier until all work-items in the current work-group have reached the barrier.

In addition, the barrier performs a fence operation ensuring that all memory accesses in the specified address space issued before the barrier complete before those issued after the barrier

Definition at line 209 of file h_item.hpp.

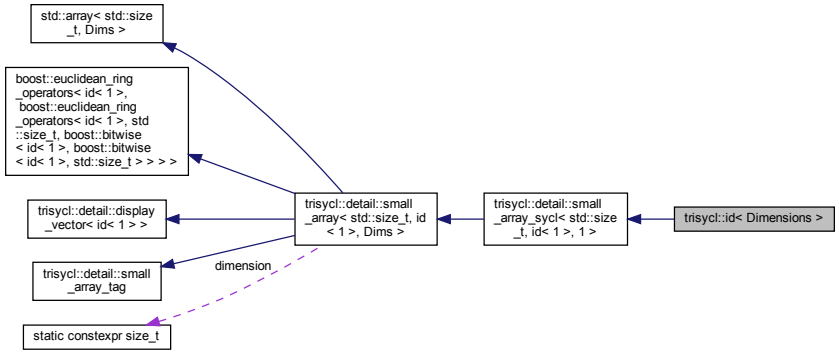
9.19.2.3 class trisycl::id

template<int Dimensions = 1>
class trisycl::id< Dimensions >



Define a multi-dimensional index, used for example to locate a work item.

Definition at line 32 of file id.hpp.

Inheritance diagram for trisycl::id< Dimensions >:

Collaboration diagram for trisycl::id< Dimensions >:

Public Member Functions

- id (const range< Dimensions > &range_size)

  Construct an id from a range.
- id (const item< Dimensions, true > &rhs)

  Construct an id from an item global_id.
- id ()

  Default constructor must 0 all elements.

Static Public Member Functions

- static auto constexpr rank ()

  The number of dimensions of the id.

Additional Inherited Members

9.19.2.3.1 Constructor & Destructor Documentation

9.19.2.3.1.1 id() [1/3] template<int Dimensions = 1>

```
trisycl::id< Dimensions >::id (
            const range< Dimensions > & range_size )  [inline]
```

Construct an id from a range.

Use the fact we have a constructor of a small_array from a another kind of small_array

Definition at line 47 of file id.hpp.

```
00051       :  detail::small_array_sycl<std::size_t, id<Dimensions>, Dimensions> {
00052         range_size
00053       } {}
```

9.19.2.3.1.2 id() [2/3] template<int Dimensions = 1>

```
trisycl::id< Dimensions >::id (
            const item< Dimensions, true > & rhs )  [inline]
```

Construct an id from an item global_id.

Definition at line 56 of file id.hpp.

```
00057     :  detail::small_array_sycl<std::size_t, id<Dimensions>, Dimensions>
00058       { rhs.get_id() }
00059   {}
```

References trisycl::item< Dimensions, with_offset >::get_id().

Here is the call graph for this function:

9.19.2.3.1.3 id() [3/3] template<int Dimensions = 1>

trisycl::id< Dimensions >::id ( ) [inline]

Default constructor must 0 all elements.

Definition at line 62 of file id.hpp.

```
00062         :  detail::small_array_sycl<std::size_t, id<Dimensions>, Dimensions> { 0 }
00063   {}
```

9.19.2.3.2 Member Function Documentation

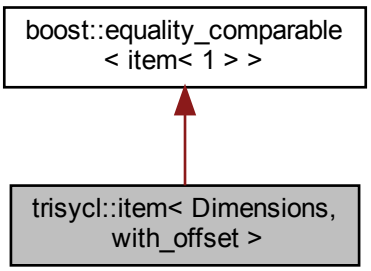
9.19.2.3.2.1 rank() template<int Dimensions = 1>

static auto constexpr trisycl::id< Dimensions >::rank ( ) [inline], [static], [constexpr]

The number of dimensions of the id.

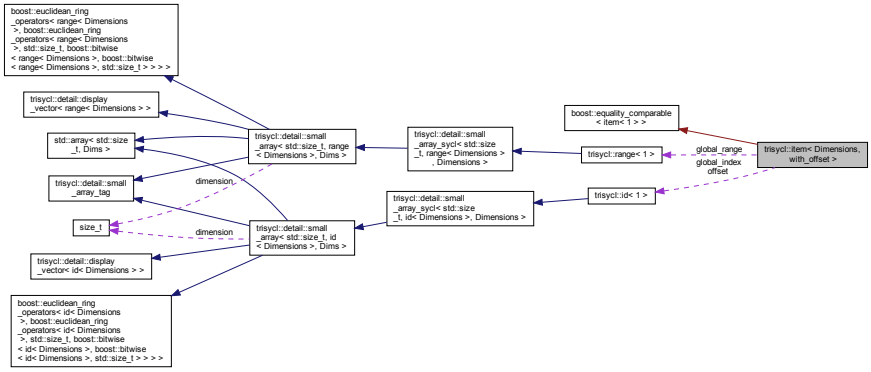
Definition at line 39 of file id.hpp.

```
00039 { return Dimensions; }
```



9.19.2.4 class trisycl::item

template<int Dimensions = 1, bool with_offset = true>
class trisycl::item< Dimensions, with_offset >



A SYCL item stores information on a work-item with some more context such as the definition range and offset.

Definition at line 28 of file item.hpp.

Inheritance diagram for trisycl::item< Dimensions, with_offset >:

Collaboration diagram for trisycl::item< Dimensions, with_offset >:

Public Member Functions

- item (range< Dimensions > global_size, id< Dimensions > global_index, id< Dimensions > offset={})

  Create an item from a local size and an optional offset.
- item ()=default

  To be able to copy and assign item, use default constructors too.
- id< Dimensions > get_id () const

  Return the constituent local or global id<> representing the work-item's position in the iteration space.
- size_t get_id (int dimension) const

  Return the requested dimension of the constituent id<> representing the work-item's position in the iteration space.
- auto & operator[ ] (int dimension)

  Return the constituent id<> l-value representing the work-item's position in the iteration space in the given dimension.
- range< Dimensions > get_range () const

  Returns a range<> representing the dimensions of the range of possible values of the item.
- size_t get_range (int dimension) const

  Return the same value as get_range().get(dimension)
- id< Dimensions > get_offset () const

  Returns an id<> representing the n-dimensional offset provided to the parallel_for and that is added by the runtime to the global-ID of each work-item, if this item represents a global range.
- size_t get_linear_id () const

  Return the linearized ID in the item's range.
- void set (id< Dimensions > Index)

  For the implementation, need to set the global index.
- operator item< Dimensions, true > () const

  Returns an item with same dimensions but offset set to 0.
- void display () const

  Display the value for debugging and validation purpose.
- bool operator== (const item< Dimensions > &itemB) const

  Comparison operators for item.

Static Public Member Functions

- static auto constexpr rank ()

  The number of dimensions of the item.

Private Attributes

- range< Dimensions > global_range
- id< Dimensions > global_index
- id< Dimensions > offset

9.19.2.4.1 Constructor & Destructor Documentation

9.19.2.4.1.1 item() [1/2] template<int Dimensions = 1, bool with_offset = true>

```
trisycl::item< Dimensions, with_offset >::item (
            range< Dimensions > global_size,
            id< Dimensions > global_index,
            id< Dimensions > offset = {} )  [inline]
```

Create an item from a local size and an optional offset.

This constructor is used by the triSYCL implementation and the non-regression testing.

Definition at line 47 of file item.hpp.

```
00049                                {}) :
00050     global_range { global_size },
00051     global_index { global_index },
00052     offset { offset }
00053   {}
```

9.19.2.4.1.2 item() [2/2] template<int Dimensions = 1, bool with_offset = true>

```
trisycl::item< Dimensions, with_offset >::item ( )  [default]
```

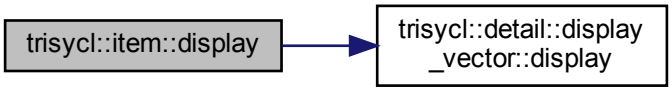
To be able to copy and assign item, use default constructors too.

Todo Make most of them protected, reserved to implementation

9.19.2.4.2 Member Function Documentation

9.19.2.4.2.1 display() template<int Dimensions = 1, bool with_offset = true>

```
void trisycl::item< Dimensions, with_offset >::display ( ) const  [inline]
```



Display the value for debugging and validation purpose.

Definition at line 124 of file item.hpp.

```
00124                        {
00125     global_range.display();
00126     global_index.display();
00127     offset.display();
00128   }
```

9.19.2.4.3.2 global_range `template<int Dimensions = 1, bool with_offset = true>`

`range<Dimensions> trisycl::item< Dimensions, with_offset >::global_range [private]`

Definition at line 36 of file item.hpp.

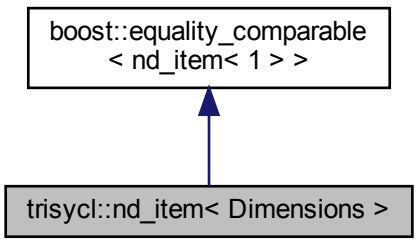
Referenced by trisycl::item< Dimensions, with_offset >::get_range(), and trisycl::item< Dimensions, with_offset >::operator==().

9.19.2.4.3.3 offset `template<int Dimensions = 1, bool with_offset = true>`

`id<Dimensions> trisycl::item< Dimensions, with_offset >::offset [private]`

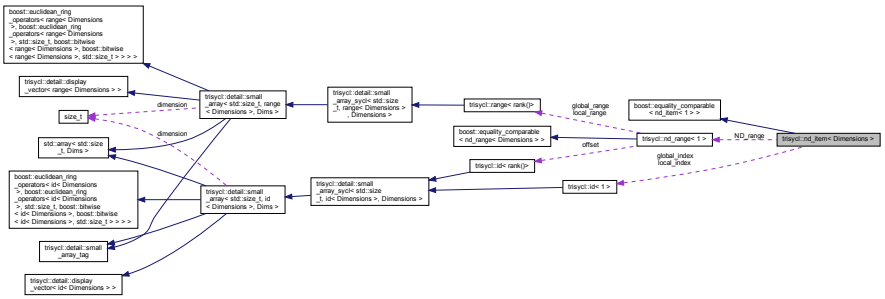
Definition at line 38 of file item.hpp.

Referenced by trisycl::item< Dimensions, with_offset >::display(), trisycl::item< Dimensions, with_offset >::get_offset(), and trisycl::item< Dimensions, with_offset >::operator==().



9.19.2.5 struct trisycl::nd_item

template< int Dimensions = 1 >
struct trisycl::nd_item< Dimensions >



A SYCL nd_item stores information on a work-item within a work-group, with some more context such as the definition ranges.

Definition at line 31 of file nd_item.hpp.

Inheritance diagram for trisycl::nd_item< Dimensions >:

Collaboration diagram for trisycl::nd_item< Dimensions >:

Public Member Functions

- nd_item (nd_range< Dimensions > ndr)

  Create an empty nd_item<> from an nd_range<>
- nd_item (id< Dimensions > global_index, nd_range< Dimensions > ndr)

  Create a full nd_item.
- nd_item ()=default

  To be able to copy and assign nd_item, use default constructors too.
- id< Dimensions > get_global_id () const

  Return the constituent global id representing the work-item's position in the global iteration space.
- size_t get_global_id (int dimension) const

  Return the constituent element of the global id representing the work-item's position in the global iteration space in the given dimension.
- size_t get_global_linear_id () const

  Return the flattened id of the current work-item after subtracting the offset.
- id< Dimensions > get_local_id () const

  Return the constituent local id representing the work-item's position within the current work-group.
- size_t get_local_id (int dimension) const

  Return the constituent element of the local id representing the work-item's position within the current work-group in the given dimension.
- size_t get_local_linear_id () const

  Return the flattened id of the current work-item within the current work-group.
- id< Dimensions > get_group () const

  Return the constituent group representing the work-group's position within the overall nd_range.
- size_t get_group (int dimension) const

  Return the constituent element of the group id representing the work-group;s position within the overall nd_range in the given dimension.
- size_t get_group_linear_id () const

  Return the flattened id of the current work-group.
- id< Dimensions > get_group_range () const

  Return the number of groups in the nd_range.
- size_t get_group_range (int dimension) const

  Return the number of groups for dimension in the nd_range.
- range< Dimensions > get_global_range () const

  Return a range<> representing the dimensions of the nd_range<>
- range< Dimensions > get_local_range () const

  Return a range<> representing the dimensions of the current work-group.
- id< Dimensions > get_offset () const

Return an id<> representing the n-dimensional offset provided to the constructor of the nd_range<> and that is added by the runtime to the global-ID of each work-item.

- nd_range< Dimensions > get_nd_range () const

  Return the nd_range<> of the current execution.

- item< Dimensions > get_item () const

  Allows projection down to an item.

- void barrier (access::fence_space flag=access::fence_space::global_and_local) const

  Execute a barrier with memory ordering on the local address space, global address space or both based on the value of flag.

- void set_local (id< Dimensions > Index)
- void set_global (id< Dimensions > Index)
- bool operator== (const nd_item< Dimensions > &nd_itemB) const

Static Public Member Functions

- static auto constexpr rank ()

  The number of dimensions of the nd_item.

Private Attributes

- id< Dimensions > global_index
- id< Dimensions > local_index
- nd_range< Dimensions > ND_range

9.19.2.5.1 Constructor & Destructor Documentation

9.19.2.5.1.1 nd_item() [1/3] template<int Dimensions = 1>

```
trisycl::nd_item< Dimensions >::nd_item (
            nd_range< Dimensions > ndr )  [inline]
```

Create an empty nd_item<> from an nd_range<>

Todo This is for the triSYCL implementation which is expected to call set_global() and set_local() later. This should be hidden to the user.

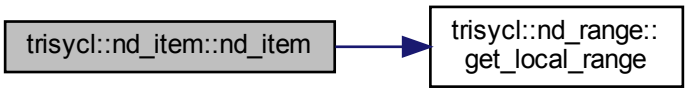
Definition at line 51 of file nd_item.hpp.

```
00051 :  ND_range { ndr } {}
```

9.19.2.5.1.2 nd_item() [2/3] template<int Dimensions = 1>

```
trisycl::nd_item< Dimensions >::nd_item (
            id< Dimensions > global_index,
            nd_range< Dimensions > ndr )  [inline]
```

Create a full nd_item.



Todo This is for validation purpose. Hide this to the programmer somehow

Definition at line 59 of file nd_item.hpp.

```
00060                                  :
00061     global_index { global_index },
00062     // Compute the local index using the offset and the group size
00063     local_index { (global_index - ndr.get_offset())%id<Dimensions> {
00064         ndr.get_local_range() } },
00065     ND_range { ndr }
00066   {}
```

References trisycl::nd_range< Dimensions >::get_local_range().

Here is the call graph for this function:

9.19.2.5.1.3 nd_item() [3/3] template<int Dimensions = 1>

```
trisycl::nd_item< Dimensions >::nd_item ( )  [default]
```

To be able to copy and assign nd_item, use default constructors too.

Todo Make most of them protected, reserved to implementation

9.19.2.5.2 Member Function Documentation

9.19.2.5.2.1 barrier() template<int Dimensions = 1>

```
void trisycl::nd_item< Dimensions >::barrier (
            access::fence_space flag = access::fence_space::global_and_local ) const  [inline]
```

Execute a barrier with memory ordering on the local address space, global address space or both based on the value of flag.

The current work-item will wait at the barrier until all work-items in the current work-group have reached the barrier.

In addition, the barrier performs a fence operation ensuring that all memory accesses in the specified address space issued before the barrier complete before those issued after the barrier

Definition at line 202 of file nd_item.hpp.

```
00203                                                 {
00204 #if defined(_OPENMP) && !defined(TRISYCL_NO_BARRIER)
00205     /* Use OpenMP barrier in the implementation with 1 OpenMP thread per
00206 work-item of the work-group */
00207 #pragma omp barrier
00208 #else
00209     // \todo To be implemented efficiently otherwise
00210     TRISYCL_UNIMPL;
00211 #endif
00212   }
```

9.19.2.7 struct trisycl::detail::parallel_for_iterate

template<std::size_t level, typename Range, typename ParallelForFunctor, typename Id>
struct trisycl::detail::parallel_for_iterate< level, Range, ParallelForFunctor, Id >

A recursive multi-dimensional iterator that ends up calling f.

The iteration order may be changed later.

Since partial specialization of function template is not possible in C++14, use a class template instead with everything in the constructor.

Definition at line 54 of file parallelism.hpp.

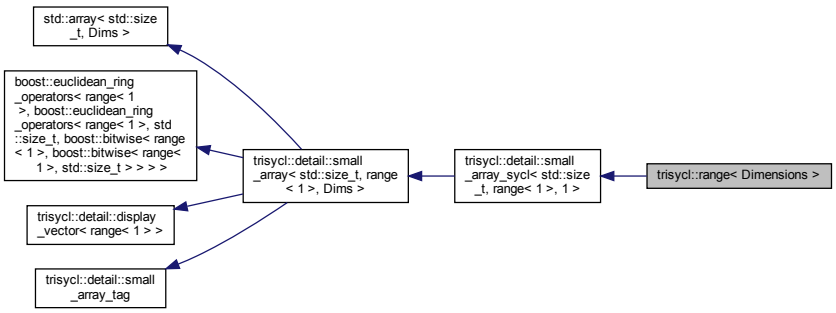
9.19.2.9 class trisycl::range

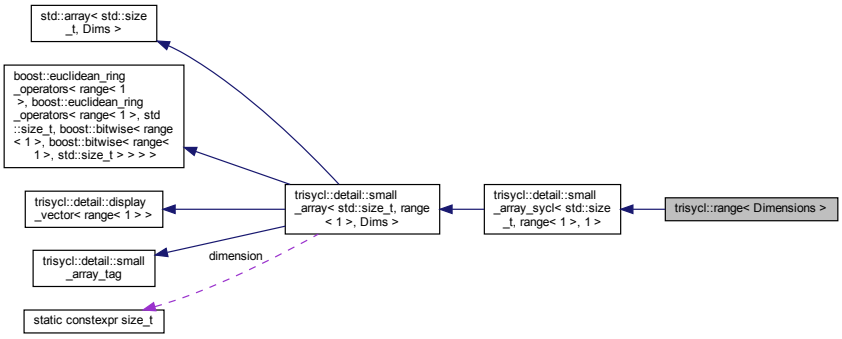
template< int Dimensions = 1 >
class trisycl::range< Dimensions >

A SYCL range defines a multi-dimensional index range that can be used to define launch parallel computation extent or buffer sizes.



Todo use std::size_t Dimensions instead of int Dimensions in the specification?

Todo add to the specification this default parameter value?



Todo add to the specification some way to specify an offset?

Definition at line 35 of file range.hpp.

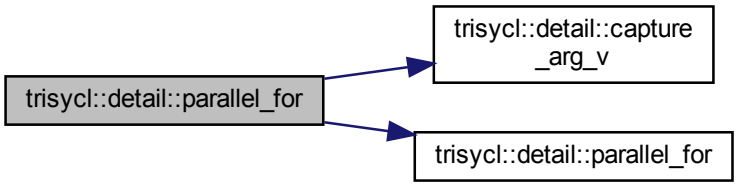
9.19.3.4 parallel_for() [2/4]

```
template<int Dimensions = 1, typename ParallelForFunctor >
void trisycl::detail::parallel_for (
            range< Dimensions > r,
            ParallelForFunctor f )
```

`#include <include/triSYCL/parallelism/detail/parallelism.hpp>`

Calls the appropriate ternary parallel_for overload based on the index type of the kernel function object f.

capture_arg_v generates a value from the type of the passed in kernels (lambdas) argument (item or id in this case) and passes it onwards to parallel_for so that it's aware which index class it's supposed to generate data for.



We erase the type then retrieve it again so that we can avoid redefining the parallel_for interface in handler.hpp for item and id as the parallel_for in the SYCL 1.2.1 spec that accepts a range can be overloaded for both.

Definition at line 218 of file parallelism.hpp.

```
00218                                                    {
00219   parallel_for(r,f, capture_arg_v(&ParallelForFunctor::operator()));
00220 }
```

9.20 Vector types in SYCL

Collaboration diagram for Vector types in SYCL:

Namespaces

- namespace trisycl

  The vector type to be used as SYCL vector.
- namespace std

Classes

- struct trisycl::elem

  Series of values to specify named swizzle indexes. More...
- class trisycl::vec< DataType, 1 >
- class trisycl::vec< DataType, 2 >
- class trisycl::vec< DataType, 3 >
- class trisycl::vec< DataType, 4 >
- class trisycl::vec< DataType, 8 >
- class trisycl::vec< DataType, 16 >

Macros

- #define TRISYCL_DECLARE_S(x)

  Accessors to access hex indexed elements of a vector.
- #define TRISYCL_GEN_SWIZ2(str, idx0, idx1)
- #define TRISYCL_GEN_SWIZ3(str, idx0, idx1, idx2)
- #define TRISYCL_GEN_SWIZ4(str, idx0, idx1, idx2, idx3)
- #define TRISYCL_DEFINE_VEC_TYPE_SIZE(type, size, actual_type) using type##size = vec<actual_type, size>;

  A macro to define type alias, such as for type=uchar, size=4 and actual_type=unsigned char, uchar4 is equivalent to vec<unsigned char, 4>
- #define TRISYCL_DEFINE_VEC_TYPE(type, actual_type)

  Declare the vector types of a type for all the sizes.

Typedefs

- template<typename DataType , int numElements>
  using trisycl::__swizzled_vec__ = vec< DataType, numElements >

Variables

- static constexpr int trisycl::elem::x = 0
- static constexpr int trisycl::elem::y = 1
- static constexpr int trisycl::elem::z = 2
- static constexpr int trisycl::elem::w = 3
- static constexpr int trisycl::elem::r = 0

9.20.3.2 TRISYCL_DEFINE_VEC_TYPE

```
#define TRISYCL_DEFINE_VEC_TYPE(
              type,
              actual_type )
```

```
#include <include/triSYCL/vec.hpp>
```

Value:

```
  TRISYCL_DEFINE_VEC_TYPE_SIZE(type, 1, actual_type)          \
  TRISYCL_DEFINE_VEC_TYPE_SIZE(type, 2, actual_type)          \
  TRISYCL_DEFINE_VEC_TYPE_SIZE(type, 3, actual_type)          \
  TRISYCL_DEFINE_VEC_TYPE_SIZE(type, 4, actual_type)          \
  TRISYCL_DEFINE_VEC_TYPE_SIZE(type, 8, actual_type)          \
  TRISYCL_DEFINE_VEC_TYPE_SIZE(type, 16, actual_type)
```

Declare the vector types of a type for all the sizes.

Definition at line 540 of file vec.hpp.

9.20.3.3 TRISYCL_DEFINE_VEC_TYPE_SIZE

```
#define TRISYCL_DEFINE_VEC_TYPE_SIZE(
              type,
              size,
              actual_type )  using type##size = vec<actual_type, size>;
```

```
#include <include/triSYCL/vec.hpp>
```

A macro to define type alias, such as for type=uchar, size=4 and actual_type=unsigned char, uchar4 is equivalent to vec<unsigned char, 4>

Definition at line 536 of file vec.hpp.

9.20.3.4 TRISYCL_GEN_SWIZ2

```
#define TRISYCL_GEN_SWIZ2(
              str,
              idx0,
              idx1 )
```

```
#include <include/triSYCL/vec.hpp>
```

Value:

```
  const __swizzled_vec__<DataType, 2> str()const {   \
     return base_vec::swizzle(idx0, idx1);            \
  }                                                   \
  __swizzled_vec__<DataType, 2> str() {               \
    return base_vec::swizzle(idx0, idx1);             \
  }
```

Definition at line 76 of file vec.hpp.

9.20.3.5 TRISYCL_GEN_SWIZ3

```
#define TRISYCL_GEN_SWIZ3(
              str,
              idx0,
              idx1,
              idx2 )
```

```
#include <include/triSYCL/vec.hpp>
```

Value:

```
  const __swizzled_vec__<DataType, 3> str()const {   \
    return base_vec::swizzle(idx0, idx1, idx2);       \
  }                                                   \
  __swizzled_vec__<DataType, 3> str() {               \
    return base_vec::swizzle(idx0, idx1, idx2);       \
  }
```

Definition at line 83 of file vec.hpp.

9.20.3.6 TRISYCL_GEN_SWIZ4

```
#define TRISYCL_GEN_SWIZ4(
              str,
              idx0,
              idx1,
              idx2,
              idx3 )
```

```
#include <include/triSYCL/vec.hpp>
```

Value:

```
  const __swizzled_vec__<DataType, 4> str()const {   \
    return base_vec::swizzle(idx0, idx1, idx2, idx3); \
  }                                                   \
  __swizzled_vec__<DataType, 4> str() {               \
    return base_vec::swizzle(idx0, idx1, idx2, idx3); \
  }
```

Definition at line 90 of file vec.hpp.

9.20.4 Typedef Documentation

9.20.4.1 __swizzled_vec__

```
template<typename DataType , int numElements>
using trisycl::__swizzled_vec__ = typedef vec<DataType, numElements>
```

```
#include <include/triSYCL/vec.hpp>
```

Definition at line 55 of file vec.hpp.

```

Definition at line 28 of file vec.hpp.

9.20.5.23 y

```
constexpr int trisycl::elem::y = 1  [static], [constexpr]
```

Definition at line 29 of file vec.hpp.

9.20.5.24 z

```
constexpr int trisycl::elem::z = 2  [static], [constexpr]
```

Definition at line 30 of file vec.hpp.

Chapter 10

Namespace Documentation

10.1 cl Namespace Reference

Namespaces

- namespace sycl

  The official SYCL 1.2.1 specification exposes the API in the cl::sycl namespace.

10.2 cl::sycl Namespace Reference

The official SYCL 1.2.1 specification exposes the API in the cl::sycl namespace.

10.2.1 Detailed Description

The official SYCL 1.2.1 specification exposes the API in the cl::sycl namespace.

10.3 std Namespace Reference

Classes

- struct hash< trisycl::buffer< T, Dimensions, Allocator > >
- struct hash< trisycl::context >
- struct hash< trisycl::device >
- struct hash< trisycl::event >
- struct hash< trisycl::kernel >
- struct hash< trisycl::platform >
- struct hash< trisycl::queue >
- struct tuple_element< I, T >

  Each tuple element type is the same, the one of any small_array heir element.
- struct tuple_element< I, trisycl::vec< T, Size > >

  The std::tuple_element specialization for vec.
- struct tuple_size< T >

  Export the dimension as its tuple size.
- struct tuple_size< trisycl::vec< T, Size > >

  The std::tuple_size specialization for vec.

Functions

- template<std::size_t I, typename T >
  requires trisycl::detail::is_small_array<T>
  decltype(auto) get (T &&e)

  The element of the tuple is the matching element of the small_array heir.
- template<int I, typename T , int Size>
  auto get (const trisycl::vec< T, Size > &v)

  Provide a get<> accessor to have C++17 structured binding working.

10.3.1 Function Documentation

10.3.1.1 get() [1/2]

```
template<int I, typename T , int Size>
auto std::get (
             const trisycl::vec< T, Size > & v )
```

Provide a get<> accessor to have C++17 structured binding working.

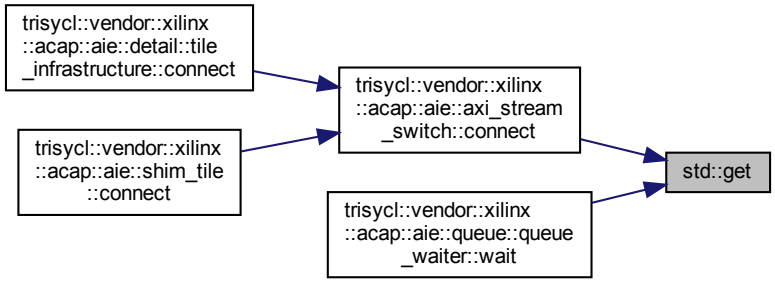
Note that it works without this with current std::array based implementation on the host device but we prefer to have a more realistic const binding

Definition at line 596 of file vec.hpp.

```
00596                                        {
00597   static_assert(I < Size, "The vec<> has not enough elements!");
00598   return v[I];
00599 }
```

10.3.1.2 get() [2/2]

```
template<std::size_t I, typename T >
requires trisycl::detail::is_small_array<T>
decltype(auto) std::get (
             T && e )
```



The element of the tuple is the matching element of the small_array heir.

Definition at line 402 of file small_array.hpp.

```
00403           {
00404   return e.get(I);
```

Referenced by trisycl::vendor::xilinx::acap::aie::axi_stream_switch< AXIStreamGeography >::connect(), and trisycl::vendor::xilinx::acap::aie::queue< AIEDevice >::queue_waiter::wait().

Here is the caller graph for this function:

10.4 sycl Namespace Reference

Expose the SYCL API directly in the sycl namespace.

10.4.1 Detailed Description

Expose the SYCL API directly in the sycl namespace.

10.5 trisycl Namespace Reference

The vector type to be used as SYCL vector.

Namespaces

- namespace access
  Describe the type of access by kernels.
- namespace detail
  Some global triSYCL configuration.
- namespace drt
  The device-side runtime.
- namespace extension
- namespace facade
- namespace info
- namespace mixin
- namespace native
- namespace property
- namespace sycl_2_2
- namespace trisycl
- namespace vendor
- namespace views

Classes

- class accessor

  The accessor abstracts the way buffer or pipe data are accessed inside a kernel in a multidimensional variable length array way. More...
- class accessor< DataType, 1, AccessMode, access::target::blocking_pipe >

  The pipe accessor abstracts the way pipe data are accessed inside a kernel. More...
- class accessor< DataType, 1, AccessMode, access::target::pipe >

  The pipe accessor abstracts the way pipe data are accessed inside a kernel. More...
- class accessor_error

  Error regarding the trisycl::accessor objects defined. More...
- struct async_exception

  An error stored in an exception_list for asynchronous errors. More...
- class buffer

  A SYCL buffer is a multidimensional variable length array (à la C99 VLA or even Fortran before) that is used to store data to work on. More...
- class cl_exception

  Returns the OpenCL error code encapsulated in the exception. More...
- class compile_program_error

  Error while compiling the SYCL kernel to a SYCL device. More...
- class context

  SYCL context. More...
- class device

  SYCL device. More...
- class device_error

  The SYCL device will trigger this exception on error. More...
- class device_selector

  The SYCL heuristics to select a device. More...
- class device_type_selector

  A device selector by device_type. More...
- class device_typename_selector

  Select a device by template device_type parameter. More...
- struct elem

  Series of values to specify named swizzle indexes. More...
- struct error_handler

  User supplied error handler to call a user-provided function when an error happens from a SYCL object that was constructed with this error handler. More...
- class event

  SYCL event.
- class event_error

  Error regarding associated trisycl::event objects. More...
- class exception

  Encapsulate a SYCL error information. More...
- struct exception_list

  Exception list to store several exceptions. More...
- class feature_not_supported

  Exception thrown when an optional feature or extension is used in a kernel but its not available on the device the SYCL kernel is being enqueued on. More...
- struct group

  A group index used in a parallel_for_workitem to specify a work_group. More...
- struct h_item

`h_item<int dimensions>` *identifies an instance of a* `group::parallel_for_work_item` *function object executing at each point in a local* `range<int dimensions>` *passed to a* `parallel_for_work_item` *call or to the corresponding* `parallel_for_work_group` *call if no range is passed to the* `parallel_for_work_item` *call. More...*

- class half
- class handler

  Command group handler class. More...
- class host_accessor

  SYCL 2020 host_accessor. More...
- class id

  Define a multi-dimensional index, used for example to locate a work item. More...
- struct image
- class invalid_object_error

  Error regarding any memory objects being used inside the kernel. More...
- class invalid_parameter_error

  Error regarding parameters to the SYCL kernel, it may apply to any captured parameters to the kernel lambda. More...
- struct is_wrapper
- class item

  A SYCL item stores information on a work-item with some more context such as the definition range and offset. More...
- class kernel

  SYCL kernel. More...
- class kernel_error

  Error that occurred before or while enqueuing the SYCL kernel. More...
- class link_program_error

  Error while linking the SYCL kernel to a SYCL device. More...
- class memory_allocation_error

  Error on memory allocation on the SYCL device for a SYCL kernel. More...
- struct nd_item

  A SYCL nd_item stores information on a work-item within a work-group, with some more context such as the definition ranges. More...
- struct nd_range

  A ND-range, made by a global and local range, to specify work-group and work-item organization. More...
- class nd_range_error

  Error regarding the trisycl::nd_range specified for the SYCL kernel. More...
- class non_cl_error

  Exception for an OpenCL operation requested in a non OpenCL area. More...
- class pipe

  SYCL pipe object. More...
- class pipe_error

  A failing pipe error will trigger this exception on error. More...
- class platform

  Abstract the OpenCL platform. More...
- class platform_error

  The SYCL platform will trigger this exception on error. More...
- class profiling_error

  The SYCL runtime will trigger this error if there is an error when profiling info is enabled. More...
- class program

  SYCL program.
- class property_list

  SYCL property list.
- class queue

SYCL queue, similar to the OpenCL queue concept. More...

- class range

  A SYCL range defines a multi-dimensional index range that can be used to define launch parallel computation extent or buffer sizes. More...
- class runtime_error
- class vec

  forward declaration to use in the detail class
- class vec< DataType, 1 >
- class vec< DataType, 16 >
- class vec< DataType, 2 >
- class vec< DataType, 3 >
- class vec< DataType, 4 >
- class vec< DataType, 8 >

Typedefs

- template<typename T >
  using constant = detail::addr_space< T, access::address_space::constant_space >

  Declare a variable to be in the OpenCL constant address space.
- template<typename T >
  using constant_ptr = constant< T * >

  Declare a variable to be in the OpenCL constant address space.
- template<typename T >
  using generic = detail::addr_space< T, access::address_space::generic_space >

  Declare a variable to be in the OpenCL 2 generic address space.
- template<typename T >
  using global = detail::addr_space< T, access::address_space::global_space >

  Declare a variable to be in the OpenCL global address space.
- template<typename T >
  using global_ptr = global< T * >

  Declare a variable to be in the OpenCL global address space.
- template<typename T >
  using local = detail::addr_space< T, access::address_space::local_space >

  Declare a variable to be in the OpenCL local address space.
- template<typename T >
  using local_ptr = local< T * >

  Declare a variable to be in the OpenCL local address space.
- template<typename T >
  using priv = detail::addr_space< T, access::address_space::private_space >

  Declare a variable to be in the OpenCL private address space.
- template<typename T >
  using private_ptr = priv< T * >

  Declare a variable to be in the OpenCL private address space.
- template<typename Pointer , access::address_space AS>
  using multi_ptr = detail::address_space_ptr< Pointer, AS >

  A pointer that can be statically associated to any address-space.
- template<typename T >
  using buffer_allocator = std::allocator< T >

  The allocator objects give the programmer some control on how the memory is allocated inside SYCL.
- template<typename T >
  using image_allocator = std::allocator< T >

  The allocator used for the `image` inside SYCL.

- template<typename T >
  using map_allocator = std::allocator< T >

  The allocator used to map the memory at the same place.
- template<class T , class Alloc = std::allocator<T>>
  using vector_class = std::vector< T, Alloc >
- using string_class = std::string
- template<class R , class... ArgTypes>
  using function_class = std::function< R(ArgTypes...)>
- using mutex_class = std::mutex
- template<class T , class D = std::default_delete<T>>
  using unique_ptr_class = std::unique_ptr< T[ ], D >
- template<class T >
  using shared_ptr_class = std::shared_ptr< T >
- template<class T >
  using weak_ptr_class = std::weak_ptr< T >
- template<class T >
  using hash_class = std::hash< T >
- using exception_ptr_class = std::exception_ptr
- using default_selector = device_typename_selector< info::device_type::automatic >

  Devices selected by heuristics of the system.
- using gpu_selector = device_typename_selector< info::device_type::gpu >

  Select devices according to device type info::device::device_type::gpu from all the available OpenCL devices.
- using cpu_selector = device_typename_selector< info::device_type::cpu >

  Select devices according to device type info::device::device_type::cpu from all the available devices and heuristics.
- using host_selector = device_typename_selector< info::device_type::host >

  Selects the SYCL host CPU device that does not require an OpenCL runtime.
- using exception_ptr = std::exception_ptr

  A shared pointer to an exception as in C++ specification.
- using async_handler = function_class< void, exception_list >
- template<typename DataType , int numElements>
  using __swizzled_vec__ = vec< DataType, numElements >

Enumerations

- enum class program_state { none , compiled , linked }
- enum class rounding_mode {
  automatic , rte , rtz , rtp ,
  rtn }

  Rounding mode for vector conversions.

Functions

- template<typename Accessor >
  static auto & get_pipe_detail (Accessor &a)

  Top-level function to break circular dependencies on the the types to get the pipe implementation.
- template<typename T , access::address_space AS>
  multi_ptr< T, AS > make_ptr (multi_ptr< T, AS > pointer)

  Construct a trisycl::multi_ptr<> with the right type.
- template<typename T , access::address_space AS>
  multi_ptr< T, AS > make_ptr (T *pointer)

  Construct a trisycl::multi_ptr<> with the right type.

- template<std::forward_iterator FIB, std::forward_iterator FIE>
  buffer (FIB begin, FIE end) -> buffer< typename std::iterator_traits< FIB >::value_type, 1 >

  A deduction guide to infer the buffer type from the read-write forward iterators into a copy-in on construction and copy-back on destruction.
- buffer (auto &host_data) -> buffer< std::ranges::range_value_t< decltype(host_data)>, 1 >

  A deduction guide to infer the buffer type from the read-write range.
- template<> auto context::get_info< info::context::reference_count > () const
- template<> auto context::get_info< info::context::platform > () const
- template<> auto context::get_info< info::context::devices > () const
- template<> auto event::get_info< info::event::command_execution_status > () const
- template<> auto event::get_info< info::event::reference_count > () const
- template<> auto event::get_profiling_info< info::event_profiling::command_submit > () const
- template<> auto event::get_profiling_info< info::event_profiling::command_start > () const
- template<> auto event::get_profiling_info< info::event_profiling::command_end > () const
- template<typename... BasicType>
  id (BasicType... Args) -> id< sizeof...(Args)>

  User-defined deduction guides to deduce the rank of an id from the number of arguments.
- TRISYCL_MATH_WRAP (abs) TRISYCL_MATH_WRAP(atan) TRISYCL_MATH_WRAP3ss(clamp) TRISYCL_MATH_WRAP2s(fmax) template< typename T
- int size auto fmax (const vec< T, size > &x, const vec< T, size > &y)
- TRISYCL_MATH_WRAP2s (fmin) template< typename T

  range (BasicType... Args) -> range< sizeof...(Args)>

  User-defined deduction guides to deduce the rank of a range from the number of arguments.

Variables

- const T & y
- const T const T & z

10.5.1 Detailed Description

The vector type to be used as SYCL vector.

Small SYCL vector class.

The exception pointer type to be used as SYCL exception pointer.

The hash type to be used as SYCL hash.

The weak pointer type to be used as SYCL weak pointer.

The shared pointer type to be used as SYCL shared pointer.

The unique pointer type to be used as SYCL unique pointer.

The mutex type to be used as SYCL mutex.

The functional type to be used as SYCL function.

The string type to be used as SYCL string.

10.5.2 Typedef Documentation

10.5.2.1 exception_ptr_class

```
using trisycl::exception_ptr_class = typedef std::exception_ptr
```

Definition at line 126 of file default_classes.hpp.

10.5.2.2 function_class

```
template<class R , class...  ArgTypes>
using trisycl::function_class = typedef std::function<R(ArgTypes...)>
```

Definition at line 50 of file default_classes.hpp.

10.5.2.3 hash_class

```
template<class T >
using trisycl::hash_class = typedef std::hash<T>
```

Definition at line 114 of file default_classes.hpp.

10.5.2.4 mutex_class

```
using trisycl::mutex_class = typedef std::mutex
```

Definition at line 62 of file default_classes.hpp.

10.5.2.5 shared_ptr_class

```
template<class T >
using trisycl::shared_ptr_class = typedef std::shared_ptr<T>
```

Definition at line 88 of file default_classes.hpp.

10.5.2.6 string_class

```
using trisycl::string_class = typedef std::string
```

Definition at line 37 of file default_classes.hpp.

10.5.2.7 unique_ptr_class

```
template<class T , class D = std::default_delete<T>>
using trisycl::unique_ptr_class = typedef std::unique_ptr<T[], D>
```

Definition at line 75 of file default_classes.hpp.

10.5.2.8 vector_class

```
template<class T , class Alloc = std::allocator<T>>
using trisycl::vector_class = typedef std::vector<T, Alloc>
```

Definition at line 25 of file default_classes.hpp.

10.5.2.9 weak_ptr_class

```
template<class T >
using trisycl::weak_ptr_class = typedef std::weak_ptr<T>
```

Definition at line 101 of file default_classes.hpp.

10.5.3 Enumeration Type Documentation

10.5.3.1 program_state

```
enum class trisycl::program_state  [strong]
```

Enumerator

none	
compiled	
linked	

Definition at line 24 of file program.hpp.

```
00024                           {
00025   none,
00026   compiled,
00027   linked
00028 };
```

10.5.3.2 rounding_mode

```
enum class trisycl::rounding_mode  [strong]
```

Rounding mode for vector conversions.

Enumerator

automatic	
rte	Default rounding mode, rtz for integers, rte for floating-point.
rtz	Round to nearest even.
rtp	Round towards zero.
rtn	Round towards positive infinity. Round towards negative infinity

Definition at line 15 of file rounding_mode.hpp.

```
00015                           {
00016   automatic, /// Default rounding mode, rtz for integers, rte for floating-point
00017   rte,       /// Round to nearest even
00018   rtz,       /// Round towards zero
00019   rtp,       /// Round towards positive infinity
00020   rtn        /// Round towards negative infinity
00021 };
```

10.5.4 Function Documentation

10.5.4.1 cross()

```
int size auto trisycl::cross (
             const vec< T, size > & x,
             const vec< T, size > & y )
```

Definition at line 296 of file math.hpp.

```
00302                                                          {
00303   static_assert((size == 4 || size == 3),
00304                 "vec type should be 3 or 4 dimensions");
00305   if constexpr (size > 3) {
00306     return vec<T, size> {
00307             (x[1] * y[2]) - (x[2] * y[1]),
```

```
00308             (x[2] * y[0]) - (x[0] * y[2]),
00309             (x[0] * y[1]) - (x[1] * y[0]),
00310             0.0};
00311   } else {
```

References x, and y.

10.5.4.2 dot()

```
template<typename T , int size>
auto trisycl::dot (
             const vec< T, size > & x,
             const vec< T, size > & y )
```

Definition at line 322 of file math.hpp.

```
00323                                                 {0}));
00324 }
```

10.5.4.3 event::get_info< info::event::command_execution_status >()

```
template<>
auto trisycl::event::get_info< info::event::command_execution_status > ( ) const  [inline]
```

Definition at line 100 of file event.hpp.

```
00100                                                                 {
00101   return implementation->get_command_execution_status();
00102 }
```

10.5.4.4 event::get_info< info::event::reference_count >()

```
template<>
auto trisycl::event::get_info< info::event::reference_count > ( ) const  [inline]
```

Definition at line 105 of file event.hpp.

```
00105                                                 {
00106   return implementation->get_reference_count();
00107 }
```

10.5.4.5 event::get_profiling_info< info::event_profiling::command_end >()

```
template<>
auto trisycl::event::get_profiling_info< info::event_profiling::command_end > ( ) const  [inline]
```

Definition at line 120 of file event.hpp.

```
00120                                                                 {
00121   return implementation->get_profiling_info(info::event_profiling::command_end);
00122 }
```

10.5.4.6 event::get_profiling_info< info::event_profiling::command_start >()

```
template<>
auto trisycl::event::get_profiling_info< info::event_profiling::command_start > ( ) const
[inline]
```

Definition at line 115 of file event.hpp.

```
00115                                                                          {
00116   return implementation->get_profiling_info(info::event_profiling::command_start);
00117 }
```

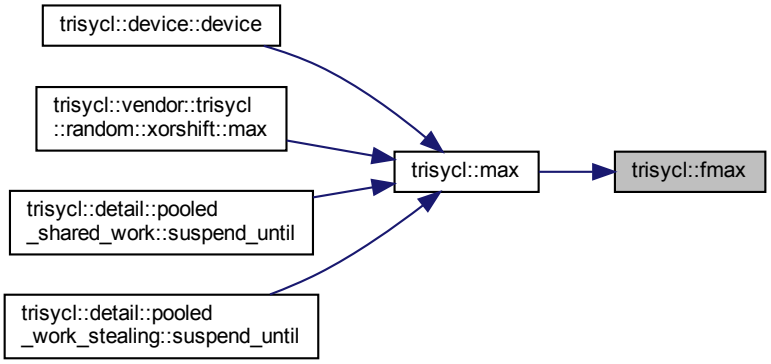
10.5.4.7 event::get_profiling_info< info::event_profiling::command_submit >()

```
template<>
auto trisycl::event::get_profiling_info< info::event_profiling::command_submit > ( ) const
[inline]
```

Definition at line 110 of file event.hpp.

```
00110                                                                          {
00111   return implementation->get_profiling_info(info::event_profiling::command_submit);
00112 }
```

10.5.4.8 fmax()



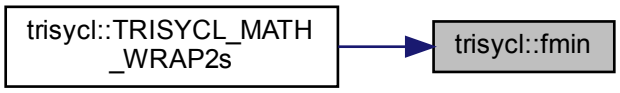
```
int size auto trisycl::fmax (
             const vec< T, size > & x,
             const vec< T, size > & y )
```

Definition at line 164 of file math.hpp.

```
00171                                {
```

Referenced by max().

Here is the caller graph for this function:



10.5.4.9 fmin()

```
int size auto trisycl::fmin (
             const vec< T, size > & x,
             const vec< T, size > & y )
```

Definition at line 180 of file math.hpp.

10.5.5.2 z

```
const T const T& trisycl::z
```

Initial value:

```
{
  return std::max(x, std::max(y, z))
```

Definition at line 207 of file math.hpp.

Referenced by trisycl::detail::vec< DataType, NumElements >::zip().

10.6 trisycl::access Namespace Reference

Describe the type of access by kernels.

Enumerations

- enum class mode {
  read = 42 , write , read_write , discard_write ,
  discard_read_write , atomic }

  This describes the type of the access mode to be used via accessor.
- enum class target {
  global_buffer = 2014 , constant_buffer , local , image ,
  host_buffer , host_image , image_array , pipe ,
  blocking_pipe }

  The target enumeration describes the type of object to be accessed via the accessor.
- enum class fence_space : char { local_space , global_space , global_and_local }

  Precise the address space a barrier needs to act on.
- enum class address_space {
  global_space , local_space , constant_space , private_space ,
  generic_space }

  Enumerate the different OpenCL 2 address spaces.

10.6.1 Detailed Description

Describe the type of access by kernels.

Todo This values should be normalized to allow separate compilation with different implementations?

10.6.2 Enumeration Type Documentation

10.6.2.1 address_space

```
enum class trisycl::access::address_space  [strong]
```

Enumerate the different OpenCL 2 address spaces.

Enumerator

global_space	
local_space	
constant_space	
private_space	
generic_space	

Definition at line 28 of file address_space.hpp.

```
00028                           {
00029   global_space,
00030   local_space,
00031   constant_space,
00032   private_space,
00033   generic_space,
00034 };
```

10.6.2.2 fence_space

```
enum class trisycl::access::fence_space :  char  [strong]
```

Precise the address space a barrier needs to act on.

Enumerator

local_space	
global_space	
global_and_local	

Definition at line 62 of file access.hpp.

```
00062                           :  char {
00063     local_space,
00064     global_space,
00065     global_and_local
00066   };
```

10.6.2.3 mode

```
enum class trisycl::access::mode  [strong]
```

This describes the type of the access mode to be used via accessor.

Enumerator

read	Read-only access. Insist on the fact that read_write != read + write
write	Write-only access, but previous content *not* discarded.
read_write	Read and write access.
discard_write	Write-only access and previous content discarded.
discard_read_write	Read and write access and previous content discarded.
atomic	Atomic access.

Definition at line 32 of file access.hpp.

```
00032                  {
00033     read = 42, /**< Read-only access.  Insist on the fact that
00034 read_write != read + write */
00035     write, ///< Write-only access, but previous content *not* discarded
00036     read_write, ///< Read and write access
00037     discard_write, ///< Write-only access and previous content discarded
00038     discard_read_write, /**< Read and write access and previous
00039 content discarded*/
00040     atomic ///< Atomic access
00041   };
```

10.6.2.4 target

```
enum class trisycl::access::target  [strong]
```

The target enumeration describes the type of object to be accessed via the accessor.

Enumerator

global_buffer	
constant_buffer	
local	
image	
host_buffer	
host_image	
image_array	
pipe	
blocking_pipe	

Definition at line 47 of file access.hpp.

```
00047                     {
00048     global_buffer = 2014, //< Just pick a random number...
00049     constant_buffer,
00050     local,
00051     image,
00052     host_buffer,
00053     host_image,
00054     image_array,
00055     pipe,
00056     blocking_pipe
00057   };
```

10.7 trisycl::detail Namespace Reference

Some global triSYCL configuration.

Namespaces

- namespace spir
- namespace sycl_2_2

Classes

- class accessor

  The buffer accessor abstracts the way buffer data are accessed inside a kernel in a multidimensional variable length array way. More...
- class accessor< T, Dimensions, Mode, access::target::local >

  The local accessor specialization abstracts the way local memory is allocated to a kernel to be shared between work-items of the same work-group. More...
- class accessor_base

  The buffer accessor base is here mainly to be accessed from the task without dependency on the buffer data types. More...
- struct address_space_array

  Implementation of an array variable with an OpenCL address space. More...
- struct address_space_base

  Implementation of the base infrastructure to wrap something in an OpenCL address space. More...
- struct address_space_fundamental

  Implementation of a fundamental type with an OpenCL address space. More...
- struct address_space_object

Implementation of an object type with an OpenCL address space. More...

- struct address_space_ptr

  Implementation for an OpenCL address space pointer. More...
- struct address_space_variable

  Implementation of a variable with an OpenCL address space. More...
- class alignment
- class alignment< ::trisycl::vec< DataType, NumElements > >
- struct bool_pack
- class buffer

  A SYCL buffer is a multidimensional variable length array (à la C99 VLA or even Fortran before) that is used to store data to work on. More...
- struct buffer_base

  Factorize some template independent buffer aspects in a base class. More...
- class buffer_waiter

  A helper class to wait for the final buffer destruction if the conditions for blocking are met. More...
- class cache

  A simple thread safe cache mechanism to cache std::shared_ptr of values indexed by keys.
- struct container_element_aspect

  A mix-in to add some container element aspects. More...
- class context
- struct debug

  Class used to trace the construction, copy-construction, move-construction and destruction of classes that inherit from it. More...
- class device

  An abstract class representing various models of SYCL devices. More...
- struct display_vector

  Class used to display a vector-like type of classes that inherit from it. More...
- struct event
- struct expand_to_vector

  Allows optional expansion of a 1-element tuple to a V::dimension tuple to replicate scalar values in vector initialization. More...
- struct expand_to_vector< V, Tuple, true >

  Specialization in the case we ask for expansion. More...
- class fiber_pool
- class host_context

  SYCL host context. More...
- class host_device

  SYCL host device.
- class host_event
- class host_platform

  SYCL host platform. More...
- class host_queue

  Some implementation details about the SYCL queue.
- struct is_range

  A type trait to check if a type it a sycl::range or not.
- struct is_range< range< Dimensions > >

  Return true if template instantiating match a sycl::range.
- class kernel

  Abstract SYCL kernel. More...
- struct ocl_type

  Generate a type with some real OpenCL 2 attribute if we are on an OpenCL device. More...
- struct ocl_type< T, access::address_space::constant_space >

Add an attribute for __constant address space. More...

- struct ocl_type< T, access::address_space::global_space >

  Add an attribute for __global address space. More...
- struct ocl_type< T, access::address_space::local_space >

  Add an attribute for __local address space. More...
- struct ocl_type< T, access::address_space::private_space >

  Add an attribute for __private address space. More...
- class opencl_context

  SYCL OpenCL context.
- class opencl_device

  SYCL OpenCL device.
- class opencl_event
- class opencl_kernel

  An abstraction of the OpenCL kernel.
- class opencl_platform

  SYCL OpenCL platform. More...
- class opencl_queue

  Some implementation details about the SYCL queue.
- struct overloaded

  Helper type for the visitor to do pattern matching on invocables https://en.cppreference.com/w/cpp/utility/variant/visit. More...
- struct parallel_for_iterate

  A recursive multi-dimensional iterator that ends up calling f. More...
- struct parallel_for_iterate< 0, Range, ParallelForFunctor, Id >

  Stop the recursion when level reaches 0 by simply calling the kernel functor with the constructed id. More...
- class platform

  An abstract class representing various models of SYCL platforms. More...
- class pooled_shared_work
- class pooled_work_stealing
- class program
- class property
- struct queue

  Some implementation details about the SYCL queue.
- struct shared_ptr_implementation

  Provide an implementation as shared_ptr with total ordering and hashing to be used with algorithms and in (un)ordered containers.
- struct singleton

  Provide a singleton factory.
- struct small_array

  Define a multi-dimensional index, used for example to locate a work item or a buffer element. More...
- struct small_array_sycl

  A small array to implement SYCL objects like id, range, item... with 1, 2 or 3 elements (or even more if detail::allow_any_dimension is true), with the implicit constructors. More...
- struct small_array_tag

  Tag to define simply inheritance from small_array. More...
- struct task

  The abstraction to represent SYCL tasks executing inside command_group.
- class vec

  forward declaration to use in the detail class

Concepts

- concept is_small_array

  Concept describing a class inheriting from small_array.

Typedefs

- template<typename T , access::address_space AS>
  using addr_space = typename std::conditional< std::is_pointer< T >::value, address_space_ptr< T, AS >, typename std::conditional< std::is_class< T >::value, address_space_object< T, AS >, typename std::conditional< std::is_array< T >::value, address_space_array< T, AS >, address_space_fundamental< T, AS > >::type >::type >::type

  Dispatch the address space implementation according to the requested type.
- template<bool... v>
  using all_true = std::is_same< bool_pack< true, v... >, bool_pack< v..., true > >
- template<typename DataType , int numElements>
  using __swizzled_base_vec__ = vec< DataType, numElements >

Functions

- template<typename BufferDetail >
  static std::shared_ptr< detail::task > buffer_add_to_task (BufferDetail buf, handler *command_group_handler, bool is_write_mode)

  Proxy function to avoid some circular type recursion.
- static std::shared_ptr< detail::task > add_buffer_to_task (handler *command_group_handler, std::shared_ptr< detail::buffer_base > b, bool is_write_mode)
- template<typename T , int Dimensions = 1, typename Allocator = buffer_allocator<std::remove_const_t<T>>>
  auto waiter (detail::buffer< T, Dimensions > *b)

  Helper function to create a new buffer_waiter.
- template<typename V , typename Tuple , std::size_t... Is>
  std::array< typename V::element_type, V::dimension > tuple_to_array_iterate (Tuple t, std::index_sequence< Is... >)

  Helper to construct an array from initializer elements provided as a tuple.
- template<typename V , typename Tuple >
  auto tuple_to_array (Tuple t)

  Construct an array from initializer elements provided as a tuple.
- template<typename V , typename Tuple >
  auto expand (Tuple t)

  Create the array data of V from a tuple of initializer.
- template<typename KernelName , typename Functor >
  auto trace_kernel (Functor f)

  Wrap a kernel functor in some tracing messages to have start/stop information when TRISYCL_TRACE_KERNEL macro is defined.
- template<typename KernelName , typename Functor >
  void instantiate_kernel (Functor f) noexcept

  Instantiate the kernel code.
- TRISYCL_WEAK_ATTRIB_PREFIX void TRISYCL_WEAK_ATTRIB_SUFFIX set_kernel_task_marker (detail::task &) noexcept

  Set the task to be used to launch the kernel.
- template<typename KernelName , typename Kernel >
  void launch_device_kernel (detail::task &t, Kernel k) noexcept

Gather in a single function what is necessary for the device compiler to outline the kernel or to set up the kernel and serialize the arguments.

- template<typename Range , typename Id >
  size_t constexpr linear_id (Range range, Id id, Id offset={})

  Compute a linearized array access used in the OpenCL 2 world.
- auto & assign_from_tuple (auto &dest, auto &&tuple)

  Assign arguments from a tuple.
- template<class... Ts>
  overloaded (Ts...) -> overloaded< Ts... >
- void unimplemented (const char *func, const char *file, int line)

  Display an "unimplemented" message.
- template<int Dimensions = 1, typename ParallelForFunctor >
  void parallel_for_workitem_in_group (const group< Dimensions > &g, ParallelForFunctor f)

  Implement the loop on the work-items inside a work-group.
- static std::shared_ptr< detail::task > add_buffer_to_task (handler *command_group_handler, std::shared_ptr< detail::buffer_base > b, bool is_write_mode)

  Register a buffer as used by a task.
- template<int Dimensions = 1, typename ParallelForFunctor , typename Id >
  void parallel_for (range< Dimensions > r, ParallelForFunctor f, Id)

  Implementation of a data parallel computation with parallelism specified at launch time by a range<>.
- template<int Dimensions = 1, typename ParallelForFunctor >
  void parallel_for (range< Dimensions > r, ParallelForFunctor f, item< Dimensions >)

  Implementation of a data parallel computation with parallelism specified at launch time by a range<>.
- template<typename F , typename R , typename A >
  auto capture_arg_v (R(F::*)(A))
- template<int Dimensions = 1, typename ParallelForFunctor >
  void parallel_for (range< Dimensions > r, ParallelForFunctor f)

  Calls the appropriate ternary parallel_for overload based on the index type of the kernel function object f.
- template<int Dimensions = 1, typename ParallelForFunctor >
  void parallel_for_global_offset (range< Dimensions > global_size, id< Dimensions > offset, ParallelForFunctor f)

  Implementation of parallel_for with a range<> and an offset.
- template<int Dimensions = 1, typename ParallelForFunctor >
  void parallel_for_workgroup (nd_range< Dimensions > r, ParallelForFunctor f)

  Implement the loop on the work-groups.
- template<int Dimensions, typename T_Item , typename ParallelForFunctor >
  void parallel_for_workitem (const group< Dimensions > &g, ParallelForFunctor f)

  Implement the loop on the work-items inside a work-group.
- template<int Dimensions = 1, typename ParallelForFunctor >
  void parallel_for (nd_range< Dimensions > r, ParallelForFunctor f)

  Implement a variation of parallel_for to take into account a nd_range<>
- static auto to_tbb_range (const range< 1 > &r)
- static auto to_tbb_range (const range< 2 > &r)
- static auto to_tbb_range (const range< 3 > &r)
- static auto to_sycl_id (const tbb::blocked_range< size_t > &in)
- static auto to_sycl_id (const tbb::blocked_range2d< size_t > &in)
- static auto to_sycl_id (const tbb::blocked_range3d< size_t > &in)
- template<typename Range , typename ParallelForFunctor >
  void parallel_for_iterate (Range r, ParallelForFunctor &f)
- auto rangeify (auto r)

  Make an explicit range<1> when an integral is provided or pass the value unchanged.

Variables

- TRISYCL_WEAK_ATTRIB_PREFIX detail::cache< cl_context, detail::opencl_context > opencl_context::cache TRISYCL_WEAK_ATTRIB_SUFFIX
- template<typename T >
  constexpr auto alignment_v = alignment<T>::value
- auto constexpr underlying_value

  Get the enum value as an integral value of the underlying integer type.
- auto constexpr enum_distance

  Get the distance between 2 enum underlying values.
- auto constexpr enum_count

  Count the number of enums between 2 enum boundaries, including the boundaries.
- constexpr bool allow_any_dimension

  Map TRISYCL_ALLOW_ANY_DIMENSION to a constexpr variable.
- constexpr bool use_native_work_item

  Map TRISYCL_USE_OPENCL_ND_RANGE to a constexpr variable.
- auto prevent_arguments_from_optimization

  Avoid the interprocedural optimization to remove these arguments in the kernel instantiation by relying on some dummy static variables.
- template<typename T >
  constexpr auto is_range_v = is_range<T>::value

  A variable to check if a type is a sycl::range or not.

10.7.1 Detailed Description

Some global triSYCL configuration.

10.7.2 Typedef Documentation

10.7.2.1 __swizzled_base_vec__

```
template<typename DataType , int numElements>
using trisycl::detail::__swizzled_base_vec__ = typedef vec<DataType, numElements>
```

Definition at line 37 of file vec.hpp.

10.7.2.2 all_true

```
template<bool... v>
using trisycl::detail::all_true = typedef std::is_same<bool_pack<true, v...>, bool_pack<v...,
true> >
```

Definition at line 16 of file all_true.hpp.

10.7.3 Function Documentation

10.7.3.1 add_buffer_to_task()

```
static std::shared_ptr< detail::task > trisycl::detail::add_buffer_to_task (
            handler * command_group_handler,
            std::shared_ptr< detail::buffer_base > b,
            bool is_write_mode )  [static]
```

Register a buffer as used by a task.

This is a proxy function to avoid complicated type recursion.

Definition at line 532 of file handler.hpp.

```
00534                                        {
00535   command_group_handler->task->add_buffer(b, is_write_mode);
00536   return command_group_handler->task;
00537 }
```

References b, and trisycl::handler::task.

10.7.3.2 assign_from_tuple()

```
auto & trisycl::detail::assign_from_tuple (
            auto & dest,
            auto && tuple )
```

Assign arguments from a tuple.

Definition at line 14 of file metaprogramming.hpp.

```
00014                                                {
00015   auto expanded_assign = [&](auto&&...  elems) mutable {
00016     // Assign from each tuple element expanded
00017     dest = { std::forward<decltype(elems)>(elems)...  };
00018   };
00019   std::apply(expanded_assign, std::forward<decltype(tuple)>(tuple));
00020   // So we can use the result of the assignment expression if needed
00021   return dest;
00022 }
```

10.7.3.3 instantiate_kernel()

```
template<typename KernelName , typename Functor >
void trisycl::detail::instantiate_kernel (
            Functor f )  [noexcept]
```

Instantiate the kernel code.

To have a clear view of what a kernel is at the LLVM IR level even when a lot of optimizations are done (-O3), call the kernel from this function marked as `noinline`, otherwise the kernel code is inlined directly where it is used.

Actually some optimizations/code restructuring might duplicate the call to `instantiate_kernel` but the `noduplicate` attribute seems incompatible with `noinline` in Clang/LLVM 3.9.1, because the inlining happen when both attributes are used...

Definition at line 51 of file instantiate_kernel.hpp.

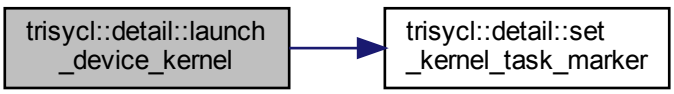
```
00051                                        {
00052   /* The outlining compiler is expected to do some massage here or
00053 around and to insert some calls to \c serialize_arg and so on */
00054   f();
00055 }
```

10.7.3.4 launch_device_kernel()

```
template<typename KernelName , typename Kernel >
void trisycl::detail::launch_device_kernel (
              detail::task & t,
              Kernel k )  [noexcept]
```

Gather in a single function what is necessary for the device compiler to outline the kernel or to set up the kernel and serialize the arguments.

The `noinline` attribute is used to force this to appear as a real function the device compiler can massage. Setup the task to be used to launch the kernel.



This is used by the outlining compiler.

Definition at line 91 of file instantiate_kernel.hpp.

```
00092                                                 {
00093 /** Setup the task to be used to launch the kernel.
00094
00095 This is used by the outlining compiler.  */
00096   detail::set_kernel_task_marker(t);
00097   /* A simplified version for the device just to be able to extract
00098 the kernel itself.
00099
00100 It is not a real outlining but a good approximation to be
00101 massaged by a compiler later.
00102
00103 Put the iteration space loops in the kernels for now, which makes
00104 sense for CPU emulation or FPGA pipelined execution.
00105 */
00106   instantiate_kernel<KernelName>(k);
00107 }
```

References set_kernel_task_marker().

Here is the call graph for this function:

10.7.3.5 rangeify()

```
auto trisycl::detail::rangeify (
              auto r )
```

Make an explicit range<1> when an integral is provided or pass the value unchanged.

Definition at line 75 of file range.hpp.

```
00075                                 {
00076       if constexpr (std::integral<decltype(r)>)
00077         return range { r };
00078       else
```

```
00079         return r;
00080     };
```

Referenced by trisycl::handler::parallel_for().

Here is the caller graph for this function:

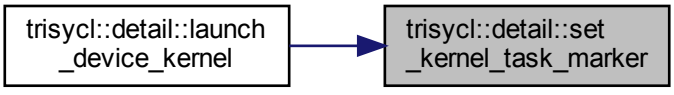
10.7.3.6 set_kernel_task_marker()

```
TRISYCL_WEAK_ATTRIB_PREFIX void TRISYCL_WEAK_ATTRIB_SUFFIX trisycl::detail::set_kernel_task_↩
marker (
             detail::task &  )  [noexcept]
```

Set the task to be used to launch the kernel.

This is actually a dummy function so that the device compiler can just grab the task for passing it to the argument serialization functions from the device runtime.

It is better to use a weak linkage than having this function with extern linkage:



- if the device compiler is used the function is kept by the compiler because full link and LTO is not applied before the device compiler passes are applied. So there is no partial evaluation in the compiler according to what is returned by this function;
- if the device compiler is not used, the code still links and can be compiled.

Definition at line 77 of file instantiate_kernel.hpp.

```
00077                                                {
00078 }
```

Referenced by launch_device_kernel().

Here is the caller graph for this function:

10.7.4 Variable Documentation

10.7.4.1 alignment_v

```
template<typename T >
constexpr auto trisycl::detail::alignment_v = alignment<T>::value  [constexpr]
```

Definition at line 42 of file alignment_helper.hpp.

10.7.4.2 allow_any_dimension

```
constexpr bool trisycl::detail::allow_any_dimension  [constexpr]
```

Initial value:

```
=
    false
```

Map TRISYCL_ALLOW_ANY_DIMENSION to a constexpr variable.

Definition at line 33 of file global_config.hpp.

10.7.4.3 enum_count

```
auto constexpr trisycl::detail::enum_count  [constexpr]
```

Initial value:

```
= [] (auto enum_start, auto enum_end) {
  return 1 + enum_distance(enum_start, enum_end);
}
```

Count the number of enums between 2 enum boundaries, including the boundaries.

Definition at line 37 of file enum.hpp.

10.7.4.4 enum_distance

```
auto constexpr trisycl::detail::enum_distance  [constexpr]
```

Initial value:

```
= [] (auto enum_start, auto enum_end) {
  static_assert(std::is_same_v<decltype(enum_start), decltype(enum_end)>,
                "enum_start and auto enum_end should have the same type");
  return underlying_value(enum_end) - underlying_value(enum_start);
}
```

Get the distance between 2 enum underlying values.

Definition at line 28 of file enum.hpp.

10.7.4.5 is_range_v

```
template<typename T >
constexpr auto trisycl::detail::is_range_v = is_range<T>::value  [constexpr]
```

A variable to check if a type is a sycl::range or not.

Definition at line 90 of file range.hpp.

10.7.4.6 prevent_arguments_from_optimization

```
auto trisycl::detail::prevent_arguments_from_optimization  [inline]
```

Initial value:

```
= [] (auto & ...args) {

  [[gnu::used]] static auto keep = std::make_tuple(& args...);
}
```

Avoid the interprocedural optimization to remove these arguments in the kernel instantiation by relying on some dummy static variables.

Using [[gnu::used]] does not work on arguments but only on static variable, so use this function.

Definition at line 28 of file instantiate_kernel.hpp.

10.7.4.7 underlying_value

```
auto constexpr trisycl::detail::underlying_value  [constexpr]
```

Initial value:

```
= [] (auto e) {
  using value_t = std::underlying_type_t<decltype(e)>;
  return static_cast<value_t>(e);
}
```

Get the enum value as an integral value of the underlying integer type.

Definition at line 21 of file enum.hpp.

Referenced by trisycl::vendor::xilinx::acap::aie::axi_stream_switch< AXIStreamGeography >::input(), and trisycl::vendor::xilinx::acap::aie::axi_stream_switch< AXIStreamGeography >::output().

10.7.4.8 use_native_work_item

```
constexpr bool trisycl::detail::use_native_work_item  [constexpr]
```

Initial value:

```
=

    false
```

Map TRISYCL_USE_OPENCL_ND_RANGE to a constexpr variable.

Definition at line 48 of file global_config.hpp.

Referenced by trisycl::handler::parallel_for().

10.8 trisycl::detail::spir Namespace Reference

Typedefs

- template<typename ScopedType >
  using storage_type_trait_t = typename storage_type_trait< ScopedType >::type

  Retrieve the type of the scoped storage of the object or `void` if none.

10.27.1 Typedef Documentation

10.27.1.1 storage_type_trait_t

```
template<typename ScopedType >
using trisycl::vendor::trisycl::scope::detail::storage_type_trait_t = typedef typename storage_type_trait<Sco
Type>::type
```

Retrieve the type of the scoped storage of the object or `void` if none.

Definition at line 30 of file util.hpp.

10.28 trisycl::vendor::xilinx Namespace Reference

Namespaces

- namespace acap
- namespace graphics
- namespace latex
- namespace partition

  Kind of array partition.

Classes

- struct partition_array

  Define an array class with partition feature. More...

Variables

- auto dataflow

  Apply dataflow execution on functions or loops.
- auto pipeline

  Execute loops in a pipelined manner.

10.28.1 Variable Documentation

10.28.1.1 dataflow

```
auto trisycl::vendor::xilinx::dataflow  [inline]
```

Initial value:

```
= [] (auto functor) noexcept {

  _ssdm_op_SpecDataflowPipeline(-1, "");
  functor();
}
```

Apply dataflow execution on functions or loops.

With this mode, Xilinx tools analyze the dataflow dependencies between sequential functions or loops and create channels (based on ping-pong RAMs or FIFOs) that allow consumer functions or loops to start operation before the producer functions or loops have completed.

This allows functions or loops to operate in parallel, which decreases latency and improves the throughput.

Parameters

in	*f*	is a function that functions or loops in f will be executed in a dataflow manner.

Definition at line 31 of file opt_decorate_func.hpp.

10.28.1.2 pipeline

```
auto trisycl::vendor::xilinx::pipeline  [inline]
```

Initial value:

```
= [] (auto functor) noexcept {

  _ssdm_op_SpecPipeline(1, 1, 0, 0, "");
```

```
  functor();
}
```

Execute loops in a pipelined manner.

A loop with pipeline mode processes a new input every clock cycle. This allows the operations of different iterations of the loop to be executed in a concurrent manner to reduce latency.

Parameters

in	*f*	is a function with an innermost loop to be executed in a pipeline way.

Definition at line 48 of file opt_decorate_func.hpp.

10.29 trisycl::vendor::xilinx::acap Namespace Reference

Namespaces

```

Definition at line 50 of file graphics.hpp.

10.35 trisycl::vendor::xilinx::latex Namespace Reference

Classes

- class context

10.36 trisycl::vendor::xilinx::partition Namespace Reference

Kind of array partition.

Classes

- struct block
  Represent a block partition.
- struct complete
  Represent a complete partition.
- struct cyclic
  Represent a cyclic partition.
- struct none
  Represent a none partition.

Enumerations

- enum class type {
  cyclic , block , complete , none ,
  cyclic , block , complete , none }
  Three real partition types: cyclic, block, complete.
- enum class type {
  cyclic , block , complete , none ,
  cyclic , block , complete , none }
  Three real partition types: cyclic, block, complete.

10.36.1 Detailed Description

Kind of array partition.

To be used when defining or declaring a vendor-supported partition array in kernel.

10.36.2 Enumeration Type Documentation

10.36.2.1 type [1/2]

```
enum class trisycl::vendor::xilinx::partition::type  [strong]
```

Three real partition types: cyclic, block, complete.

none represents non partitioned standard array.

Enumerator

cyclic	
block	
complete	
none	
cyclic	
block	
complete	
none	

Definition at line 36 of file partition_array.hpp.

```
00036                   {
00037     cyclic,
00038     block,
00039     complete,
00040     none
00041   };
```

10.36.2.2 type [2/2]

```
enum class trisycl::vendor::xilinx::partition::type  [strong]
```

Three real partition types: cyclic, block, complete.

none represents non partitioned standard array.

Enumerator

cyclic	
block	
complete	
none	
cyclic	
block	
complete	
none	

Definition at line 36 of file partition_array.hpp.

```
00036                   {
00037     cyclic,
00038     block,
00039     complete,
00040     none
00041   };
```

10.37 trisycl::views Namespace Reference

Variables

- auto constexpr enum_underlying_type

Construct a range of integral values iterating between 2 enum values, inclusive.

- auto constexpr enum_type

  Construct a range iterating between 2 enum values, inclusive.

10.37.1 Variable Documentation

10.37.1.1 enum_type

```
auto constexpr trisycl::views::enum_type  [constexpr]
```

Initial value:

```
= [] (auto begin, auto inclusive_end) {
  using begin_t = decltype(begin);
  return enum_underlying_type(begin, inclusive_end)
    | ranges::views::transform([] (auto i) { return static_cast<begin_t>(i); });
}
```

Construct a range iterating between 2 enum values, inclusive.

Parameters

begin	is the starting value
inclusive_end	is the value to stop at.

Note that since `inclusive_end` is included in the range, the range has at least 1 element.

Returns

a range of enum values from `begin` to the `inclusive_end`

Definition at line 56 of file ranges.hpp.

Referenced by trisycl::vendor::xilinx::acap::aie::detail::tile_infrastructure< Geography >::tile_infrastructure().

10.37.1.2 enum_underlying_type

```
auto constexpr trisycl::views::enum_underlying_type  [constexpr]
```

Initial value:

```
= [] (auto begin, auto inclusive_end) {
  using begin_t = decltype(begin);
  using inclusive_end_t = decltype(inclusive_end);
  static_assert(std::is_same_v<begin_t, inclusive_end_t>,
                "begin and inclusive_end should be from the same enum");
  return ranges::iota_view { detail::underlying_value(begin),
                             detail::underlying_value(inclusive_end) + 1 };
}
```

Construct a range of integral values iterating between 2 enum values, inclusive.

Parameters

begin	is the starting value
inclusive_end	is the value to stop at.

Note that since `inclusive_end` is included in the range, the range has at least 1 element.

Returns

a range of integral values of the underlying type of the enum from `begin` to the `inclusive_end`

Definition at line 33 of file ranges.hpp.

Chapter 11

Concept Documentation

11.1 trisycl::detail::is_small_array Concept Reference

Concept describing a class inheriting from small_array.

`#include <small_array.hpp>`

11.1.1 Concept definition

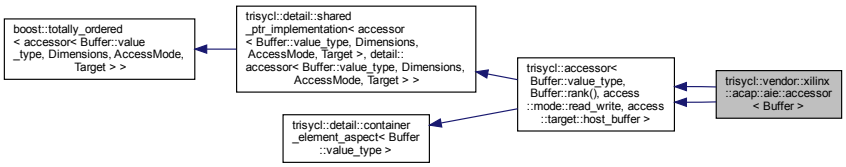
```
template<typename T>
concept trisycl::detail::is_small_array =  std::derived_from<T, trisycl::detail::small_array_tag>
```

11.1.2 Detailed Description

Concept describing a class inheriting from small_array.

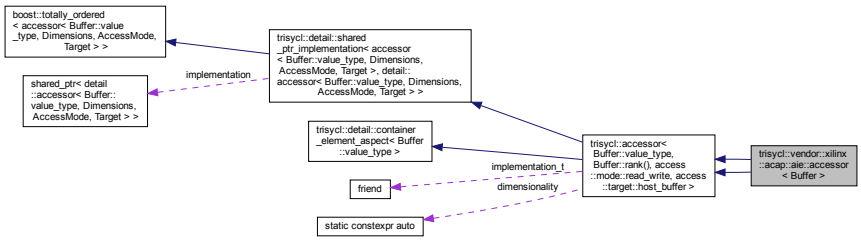
Definition at line 40 of file small_array.hpp.

Chapter 12



Class Documentation

12.1 trisycl::vendor::xilinx::acap::aie::accessor< Buffer > Class Template Reference



Create a SYCL-like device view of an AI Engine CGRA with some layout.

`#include <accessor.hpp>`

Inheritance diagram for trisycl::vendor::xilinx::acap::aie::accessor< Buffer >:

- accessor (Buffer &b, auto &cgh)
- accessor (Buffer &b, auto &cgh)
- template<typename Allocator >
  accessor (buffer< DataType, Dimensions, Allocator > &target_buffer, handler &command_group_handler)

  Construct a buffer accessor from a buffer using a command group handler object from the command group scope.
- template<typename Allocator >
  accessor (buffer< DataType, Dimensions, Allocator > &target_buffer)

  Construct a buffer accessor from a buffer.
- template<typename Allocator >
  accessor (buffer< DataType, Dimensions, Allocator > &target_buffer, handler &command_group_handler, const range< Dimensions > &offset, const range< Dimensions > &range)

  Construct a buffer accessor from a buffer given a specific range for access permissions and an offset that provides the starting point for the access range using a command group handler object from the command group scope.
- accessor (const range< Dimensions > &allocation_size, handler &command_group_handler)

  Construct an accessor of dimension Dimensions with elements of type DataType using the passed range to specify the size in each dimension.
- template<typename Allocator >
  accessor (buffer< DataType, Dimensions, Allocator > &target_buffer, handler &command_group_handler)

  Construct a buffer accessor from a buffer using a command group handler object from the command group scope.
- template<typename Allocator >
  accessor (buffer< DataType, Dimensions, Allocator > &target_buffer)

  Construct a buffer accessor from a buffer.
- template<typename Allocator >
  accessor (buffer< DataType, Dimensions, Allocator > &target_buffer, handler &command_group_handler, const range< Dimensions > &offset, const range< Dimensions > &range)

  Construct a buffer accessor from a buffer given a specific range for access permissions and an offset that provides the starting point for the access range using a command group handler object from the command group scope.
- accessor (const range< Dimensions > &allocation_size, handler &command_group_handler)

  Construct an accessor of dimension Dimensions with elements of type DataType using the passed range to specify the size in each dimension.

Private Types

- using base = ::trisycl::accessor< typename Buffer::value_type, Buffer::rank(), access::mode::read_write, access::target::host_buffer >
- using base = ::trisycl::accessor< typename Buffer::value_type, Buffer::rank(), access::mode::read_write, access::target::host_buffer >

Additional Inherited Members

12.1.1 Detailed Description

template<typename Buffer>
class trisycl::vendor::xilinx::acap::aie::accessor< Buffer >

Create a SYCL-like device view of an AI Engine CGRA with some layout.

Parameters

Layout	is the layout description of the machine to instantiate with the physical size

Definition at line 28 of file accessor.hpp.

12.1.2 Member Typedef Documentation

12.1.2.1 base [1/2]

```
template<typename Buffer >
using trisycl::vendor::xilinx::acap::aie::accessor< Buffer >::base = ::trisycl::accessor<typename
Buffer::value_type, Buffer::rank(), access::mode::read_write, access::target::host_buffer>
[private]
```

Definition at line 33 of file accessor.hpp.

12.1.2.2 base [2/2]

```
template<typename Buffer >
using trisycl::vendor::xilinx::acap::aie::accessor< Buffer >::base = ::trisycl::accessor<typename
Buffer::value_type, Buffer::rank(), access::mode::read_write, access::target::host_buffer>
[private]
```

Definition at line 33 of file accessor.hpp.

12.1.3 Constructor & Destructor Documentation

12.1.3.1 accessor() [1/10]

```
template<typename Buffer >
trisycl::vendor::xilinx::acap::aie::accessor< Buffer >::accessor (
            Buffer & b,
            auto & cgh )  [inline]
```

Definition at line 40 of file accessor.hpp.

```
00041     : base { b } {}
```

12.1.3.2 accessor() [2/10]

```
template<typename Buffer >
trisycl::vendor::xilinx::acap::aie::accessor< Buffer >::accessor (
            Buffer & b,
            auto & cgh )  [inline]
```

Definition at line 40 of file accessor.hpp.

```
00041     :  base { b } {}
```

12.1.3.3 accessor() [3/10]

```
template<typename Buffer >
template<typename Allocator >
trisycl::accessor< DataType, Dimensions, AccessMode, Target >::accessor (
            buffer< DataType, Dimensions, Allocator > & target_buffer,
            handler & command_group_handler )  [inline]
```

Construct a buffer accessor from a buffer using a command group handler object from the command group scope.

Constructor only available for global_buffer or constant_buffer target.

access_target defines the form of access being obtained.

Todo Add template allocator type in all the accessor constructors in the specification or just use a more opaque Buffer type?

Todo fix specification where access mode should be target instead

Definition at line 104 of file accessor.hpp.

```
00105                                           :  implementation_t {
00106     new detail::accessor<DataType, Dimensions, AccessMode, Target> {
00107       target_buffer.implementation->implementation, command_group_handler }
00108   } {
00109     static_assert(Target == access::target::global_buffer
00110                   || Target == access::target::constant_buffer,
00111                   "access target should be global_buffer or constant_buffer "
00112                   "when a handler is used");
00113     // Now the implementation is created, register it
00114     implementation->register_accessor();
00115   }
```

12.1.3.4 accessor() [4/10]

```
template<typename Buffer >
template<typename Allocator >
trisycl::accessor< DataType, Dimensions, AccessMode, Target >::accessor (
            buffer< DataType, Dimensions, Allocator > & target_buffer )  [inline]
```

Construct a buffer accessor from a buffer.

Constructor only available for host_buffer target.

access_target defines the form of access being obtained.

Definition at line 125 of file accessor.hpp.

```
00126     :  implementation_t {
00127     new detail::accessor<DataType, Dimensions, AccessMode, Target> {
00128       target_buffer.implementation->implementation }
00129   } {
00130     static_assert(Target == access::target::host_buffer,
00131                   "without a handler, access target should be host_buffer");
00132   }
```

12.1.3.5 accessor() [5/10]

```
template<typename Buffer >
template<typename Allocator >
trisycl::accessor< DataType, Dimensions, AccessMode, Target >::accessor (
            buffer< DataType, Dimensions, Allocator > & target_buffer,
            handler & command_group_handler,
            const range< Dimensions > & offset,
            const range< Dimensions > & range )  [inline]
```

Construct a buffer accessor from a buffer given a specific range for access permissions and an offset that provides the starting point for the access range using a command group handler object from the command group scope.

This accessor limits the processing of the buffer to the [offset, offset+range[for every dimension. Any other parts of the buffer will be unaffected.

Constructor only available for access modes global_buffer, and constant_buffer (see Table "Buffer accessor constructors"). access_target defines the form of access being obtained.

This accessor is recommended for discard-write and discard read write access modes, when the unaffected parts of the processing should be retained.

Definition at line 153 of file accessor.hpp.

```
00156                                          {
00157     TRISYCL_UNIMPL;
00158   }
```

12.1.3.6 accessor() [6/10]

```
template<typename Buffer >
trisycl::accessor< DataType, Dimensions, AccessMode, Target >::accessor (
            const range< Dimensions > & allocation_size,
            handler & command_group_handler )  [inline]
```

Construct an accessor of dimension Dimensions with elements of type DataType using the passed range to specify the size in each dimension.

It needs as a parameter a command group handler object from the command group scope. Constructor only available if AccessMode is local, see Table 3.25.

Definition at line 169 of file accessor.hpp.

```
00171     :  implementation_t { new detail::accessor<DataType,
00172                                                Dimensions,
00173                                                AccessMode,
00174                                                access::target::local> {
00175       allocation_size, command_group_handler
00176         }
00177   }
00178   {
00179     static_assert(Target == access::target::local,
00180                   "This accessor constructor requires "
00181                   "access target be local");
00182   }
```

12.1.3.7 accessor() [7/10]

```
template<typename Buffer >
template<typename Allocator >
trisycl::accessor< DataType, Dimensions, AccessMode, Target >::accessor (
            buffer< DataType, Dimensions, Allocator > & target_buffer,
            handler & command_group_handler )  [inline]
```

Construct a buffer accessor from a buffer using a command group handler object from the command group scope.

Constructor only available for global_buffer or constant_buffer target.

access_target defines the form of access being obtained.

Todo Add template allocator type in all the accessor constructors in the specification or just use a more opaque Buffer type?

Todo fix specification where access mode should be target instead

Definition at line 104 of file accessor.hpp.

```
00105                                       :  implementation_t {
00106     new detail::accessor<DataType, Dimensions, AccessMode, Target> {
00107       target_buffer.implementation->implementation, command_group_handler }
00108   } {
00109     static_assert(Target == access::target::global_buffer
00110                   || Target == access::target::constant_buffer,
00111                   "access target should be global_buffer or constant_buffer "
00112                   "when a handler is used");
00113     // Now the implementation is created, register it
00114     implementation->register_accessor();
00115   }
```

12.1.3.8 accessor() [8/10]

```
template<typename Buffer >
template<typename Allocator >
trisycl::accessor< DataType, Dimensions, AccessMode, Target >::accessor (
            buffer< DataType, Dimensions, Allocator > & target_buffer )  [inline]
```

Construct a buffer accessor from a buffer.

Constructor only available for host_buffer target.

access_target defines the form of access being obtained.

Definition at line 125 of file accessor.hpp.

```
00126     :  implementation_t {
00127     new detail::accessor<DataType, Dimensions, AccessMode, Target> {
00128       target_buffer.implementation->implementation }
00129   } {
00130     static_assert(Target == access::target::host_buffer,
00131                   "without a handler, access target should be host_buffer");
00132   }
```

12.1.3.9 accessor() [9/10]

```
template<typename Buffer >
template<typename Allocator >
trisycl::accessor< DataType, Dimensions, AccessMode, Target >::accessor (
            buffer< DataType, Dimensions, Allocator > & target_buffer,
            handler & command_group_handler,
            const range< Dimensions > & offset,
            const range< Dimensions > & range )  [inline]
```

Construct a buffer accessor from a buffer given a specific range for access permissions and an offset that provides the starting point for the access range using a command group handler object from the command group scope.

This accessor limits the processing of the buffer to the [offset, offset+range[for every dimension. Any other parts of the buffer will be unaffected.

Constructor only available for access modes global_buffer, and constant_buffer (see Table "Buffer accessor constructors"). access_target defines the form of access being obtained.

This accessor is recommended for discard-write and discard read write access modes, when the unaffected parts of the processing should be retained.

Definition at line 153 of file accessor.hpp.

```
00156                                          {
00157     TRISYCL_UNIMPL;
00158   }
```

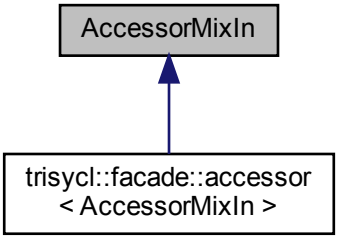
12.1.3.10 accessor() [10/10]

```
template<typename Buffer >
trisycl::accessor< DataType, Dimensions, AccessMode, Target >::accessor (
            const range< Dimensions > & allocation_size,
            handler & command_group_handler )  [inline]
```

Construct an accessor of dimension Dimensions with elements of type DataType using the passed range to specify the size in each dimension.

It needs as a parameter a command group handler object from the command group scope. Constructor only available if AccessMode is local, see Table 3.25.

Definition at line 169 of file accessor.hpp.



```
00171     :  implementation_t { new detail::accessor<DataType,
00172                                                Dimensions,
00173                                                AccessMode,
00174                                                access::target::local> {
00175       allocation_size, command_group_handler
00176         }
00177   }
00178   {
00179     static_assert(Target == access::target::local,
00180                   "This accessor constructor requires "

12.5 trisycl::vendor::xilinx::graphics::application Struct Reference

A graphics application running in a separate thread to display images in a grid of tiles.

`#include <graphics.hpp>`

Collaboration diagram for trisycl::vendor::xilinx::graphics::application:

Public Member Functions

- auto & start (int &argc, char **&argv, int nx, int ny, int image_x, int image_y, int zoom)
  Start the graphics application.
- void wait ()
  Wait for the graphics window to end.
- bool is_done ()
  Test if the window has been closed.
- bool is_done_barrier ()
  Test if the window has been closed after synchronizing with a barrier.
- template<typename DataType , typename RangeValue >
  void update_tile_data_image (int x, int y, DataType data, RangeValue min_value, RangeValue max_value)
  Update the image of a tile.
- graphics::image_grid & image_grid ()
  Return the image_grid in this application.
- ~application ()
  The destructor waiting for graphics to end.
- auto & start (int &argc, char **&argv, int nx, int ny, int image_x, int image_y, int zoom)
  Start the graphics application.
- void wait ()
  Wait for the graphics window to end.
- bool is_done ()
  Test if the window has been closed.
- bool is_done_barrier ()
  Test if the window has been closed after synchronizing with a barrier.

- template<typename DataType , typename RangeValue >
  void update_tile_data_image (int x, int y, DataType data, RangeValue min_value, RangeValue max_value)

  Update the image of a tile.
- graphics::image_grid & image_grid ()

  Return the image_grid in this application.
- ~application ()

  The destructor waiting for graphics to end.

Public Attributes

- std::thread t
- std::unique_ptr< graphics::image_grid > w
- bool initialized = false

12.5.1 Detailed Description

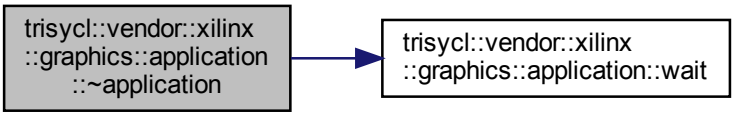
A graphics application running in a separate thread to display images in a grid of tiles.

Definition at line 594 of file graphics.hpp.

12.5.2 Constructor & Destructor Documentation

12.5.2.1 ~application() [1/2]

```
trisycl::vendor::xilinx::graphics::application::~application ( )  [inline]
```



The destructor waiting for graphics to end.

Definition at line 703 of file graphics.hpp.

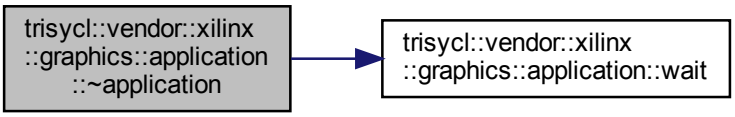
```
00703                 {
00704     // If the graphics thread is still running, wait for it to exit
00705     if (t.joinable())
00706       wait();
00707   }
```

References t, and wait().

Here is the call graph for this function:

12.5.2.2 ~application() [2/2]

```
trisycl::vendor::xilinx::graphics::application::~application ( )  [inline]
```



The destructor waiting for graphics to end.

Definition at line 703 of file graphics.hpp.

```
00703                  {
00704     // If the graphics thread is still running, wait for it to exit
00705     if (t.joinable())
00706       wait();
00707   }
```

12.5.3.7 start() [1/2]

```
auto & trisycl::vendor::xilinx::graphics::application::start (
            int & argc,
            char **& argv,
            int nx,
            int ny,
            int image_x,
            int image_y,
            int zoom )  [inline]
```

Start the graphics application.

Parameters

in,out	*argc*	is the standard C program argument number
in,out	*argv*	is the standard C program argument array
in	*nx*	is the numer of tiles horizontally
in	*ny*	is the numer of tiles vertically
in	*image_x*	is the horizontal image pixel size
in	*image_y*	is the vertical image pixel size
in	*zoom*	is the zooming factor applied to image pixels, both horizontally and vertically

Returns

a reference on ∗this to allow operation chaining

Definition at line 618 of file graphics.hpp.

```
00619                                                                    {
00620     // To be sure not passing over the asynchronous graphics start
00621     std::promise<void> graphics_initialization;
00622
00623     /* Put all the graphics in its own thread.  Since
00624 Gtk::Application::create might modify argc and argv, capture by

00648
00649     return *this;
00650   }
```

References a, t, and w.

12.5.3.9 update_tile_data_image() [1/2]

```
template<typename DataType , typename RangeValue >
void trisycl::vendor::xilinx::graphics::application::update_tile_data_image (
            int x,
            int y,
            DataType data,
            RangeValue min_value,
            RangeValue max_value )  [inline]
```

Update the image of a tile.

Parameters

in	*x*	is the tile horizontal id
in	*y*	is the tile vertical id
in	*data*	is a 2D MDspan of extent at most image_y by image_x (only the pixels of the extents are drawn) or a pointer to a 2D linearized area of exactly image_y by image_x pixel values
in	*min_value*	is the value represented with minimum of graphics palette color
in	*max_value*	is the value represented with maximum of graphics palette color

Definition at line 688 of file graphics.hpp.

```
00691                                                 {
00692     w->update_tile_data_image(x, y, data, min_value, max_value);
00693   };
```

References w, x, and trisycl::y.

12.5.3.10 update_tile_data_image() [2/2]

```
template<typename DataType , typename RangeValue >
void trisycl::vendor::xilinx::graphics::application::update_tile_data_image (
            int x,
            int y,
            DataType data,
            RangeValue min_value,
            RangeValue max_value )  [inline]
```

Update the image of a tile.

Parameters

in	*x*	is the tile horizontal id
in	*y*	is the tile vertical id
in	*data*	is a 2D MDspan of extent at most image_y by image_x (only the pixels of the extents are drawn) or a pointer to a 2D linearized area of exactly image_y by image_x pixel values

12.7 trisycl::vendor::xilinx::partition::block< ElmInEachPhyMem, PDim > Struct Template Reference

Represent a block partition.

`#include <partition_array.hpp>`

Collaboration diagram for trisycl::vendor::xilinx::partition::block< ElmInEachPhyMem, PDim >:

Static Public Attributes

- static constexpr auto ele_in_each_physical_mem = ElmInEachPhyMem
- static constexpr auto partition_dim = PDim
- static constexpr auto partition_type = type::block

12.7.1 Detailed Description

template<std::size_t ElmInEachPhyMem = 1, std::size_t PDim = 1>
struct trisycl::vendor::xilinx::partition::block< ElmInEachPhyMem, PDim >

Represent a block partition.

The single array would be partitioned into several small physical memories and can be accessed simultaneously, too. However, the first physical memory will be filled up first, then the next.

That is if we have a 4-element array which contains 4 integers 0, 1, 2, and 3. If we set factor to 2, and partition dimension to 1 for this cyclic partition array. Then, the contents of this array will be distributed to 2 physical memories: one contains 1, 2 and the other contains 3,4.

Parameters

ElmInEachPhyMem	is the number of elements in each physical memory that user wants to have.
PDim	is the dimension that user wants to apply block partition on. If PDim is 0, all dimensions will be partitioned with block order.

Todo Deal with multi-dimension array. Now, since we can only deal with 1-dim, PDim is set to 1 by default.

The single array would be partitioned into several small physical memories and can be accessed simultaneously, too. However, the first physical memory will be filled up first, then the next.

That is if we have a 4-element array which contains 4 integers 0, 1, 2, and 3. If we set factor to 2, and partition dimension to 1 for this cyclic partition array. Then, the contents of this array will be distributed to 2 physical memories: one contains 1, 2 and the other contains 3,4.

12.9 trisycl::detail::cache< Key, Value > Class Template Reference

A simple thread safe cache mechanism to cache std::shared_ptr of values indexed by keys.

```
#include <cache.hpp>
```

Collaboration diagram for trisycl::detail::cache< Key, Value >:

Public Types

- using key_type = Key

  The type of the keys used to indexed the cache.
- using value_type = Value

  The base type of the values stored in the cache.

Public Member Functions

- template<typename Functor >
  std::shared_ptr< value_type > get_or_register (const key_type &k, Functor &&create_element)

  Get a value stored in the cache if present or insert by calling a generator function.
- void remove (const key_type &k)

  Remove an entry from the cache.

Private Attributes

- std::unordered_map< key_type, std::weak_ptr< value_type > > c

  The caching storage.
- std::mutex m

  To make the cache thread-safe.

12.9.1 Detailed Description

template<typename Key, typename Value>
class trisycl::detail::cache< Key, Value >

A simple thread safe cache mechanism to cache std::shared_ptr of values indexed by keys.

Since internally only std::weak_ptr are stored, this does not prevent object deletion but it is up to the programmer not to use this cache to retrieve deleted objects.

Definition at line 27 of file cache.hpp.

12.9.2 Member Typedef Documentation

12.9.2.1 key_type

```
template<typename Key , typename Value >
using trisycl::detail::cache< Key, Value >::key_type = Key
```

The type of the keys used to indexed the cache.

Definition at line 32 of file cache.hpp.

12.9.2.2 value_type

```
template<typename Key , typename Value >
using trisycl::detail::cache< Key, Value >::value_type = Value
```

The base type of the values stored in the cache.

Definition at line 35 of file cache.hpp.

12.9.3 Member Function Documentation

12.9.3.1 get_or_register()

```
template<typename Key , typename Value >
template<typename Functor >
std::shared_ptr< value_type > trisycl::detail::cache< Key, Value >::get_or_register (
            const key_type & k,
            Functor && create_element )  [inline]
```

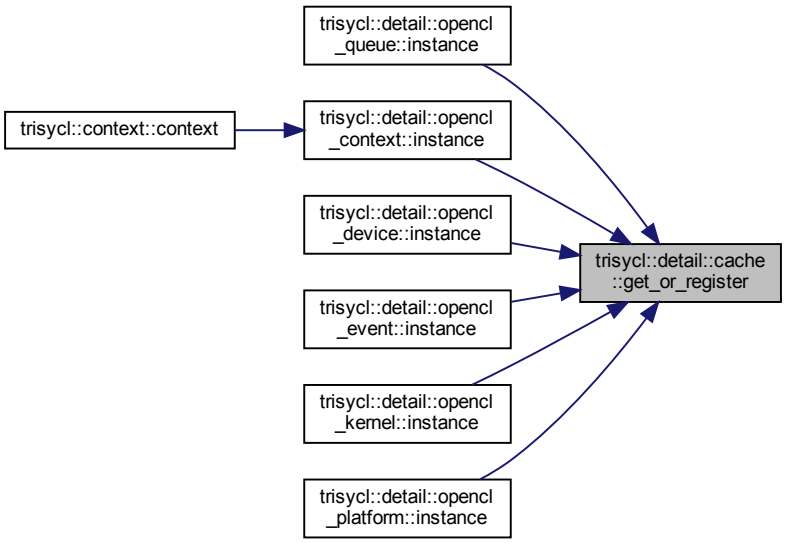
Get a value stored in the cache if present or insert by calling a generator function.

Parameters

in	*k*	is the key used to retrieve the value
in	*create_element*	is the function to be called if the key is not found in the cache to generate a value which is inserted for the key. This function has to produce a value convertible to a shared_ptr

Returns

a shared_ptr to the value retrieved or inserted



Definition at line 60 of file cache.hpp.

```
00061                                                                    {
00062     std::lock_guard<std::mutex> lg { m };
00063
00064     auto i = c.find(k);
00065     if (i != c.end())
00066       if (auto observe = i->second.lock())
00067         // Returns \c shared_ptr only if target object is still alive
00068         return observe;
00069
00070     // Otherwise create and insert a new element
00071     std::shared_ptr<value_type> e { create_element() };
00072     c.insert({ k, e });
00073     return e;
00074   }
```

```

12.11.3 Member Function Documentation

12.11.3.1 device_scope() [1/2]

```
template<typename Device , typename QueueStorage = empty_queue_scope>
template<typename CGH >
auto & trisycl::vendor::trisycl::scope::queue< Device, QueueStorage >::command_group< CGH >↩
::device_scope ( )  [inline]
```

Provide access to the device scope from inside the kernel.

Definition at line 188 of file queue.hpp.

```
00188 { return d.get_storage(); }
```

12.11.3.2 device_scope() [2/2]

```
template<typename Device , typename QueueStorage = empty_queue_scope>
template<typename CGH >
auto & trisycl::vendor::trisycl::scope::queue< Device, QueueStorage >::command_group< CGH >↩
::device_scope ( )  [inline]
```

Provide access to the device scope from inside the kernel.

Definition at line 188 of file queue.hpp.

```
00188 { return d.get_storage(); }
```

12.11.3.3 operator::trisycl::handler &() [1/2]

```
template<typename Device , typename QueueStorage = empty_queue_scope>
template<typename CGH >
trisycl::vendor::trisycl::scope::queue< Device, QueueStorage >::command_group< CGH >::operator↩
::trisycl::handler & ( )  [inline]
```

Add a conversion to `trisycl::handler&` so the usual methods such as `get_access` can still work.

Definition at line 162 of file queue.hpp.

```
00162                                {
00163       return cgh;
00164     }
```

12.11.3.4 operator::trisycl::handler &() [2/2]

```
template<typename Device , typename QueueStorage = empty_queue_scope>
template<typename CGH >
trisycl::vendor::trisycl::scope::queue< Device, QueueStorage >::command_group< CGH >::operator↩
::trisycl::handler & ( )  [inline]
```

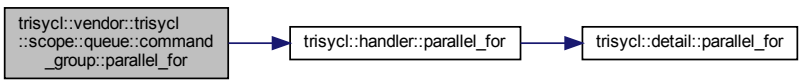
Add a conversion to `trisycl::handler&` so the usual methods such as `get_access` can still work.

Definition at line 162 of file queue.hpp.

```
00162                                {
00163       return cgh;
00164     }
```

12.11.3.5 parallel_for() [1/2]

```
template<typename Device , typename QueueStorage = empty_queue_scope>
template<typename CGH >
template<typename KernelName , int Rank, typename Kernel >
void trisycl::vendor::trisycl::scope::queue< Device, QueueStorage >::command_group< CGH >↩
::parallel_for (
             ::trisycl::range< Rank > num_work_items,
             Kernel k )  [inline]
```



Parallel kernel invocation method on a range iteration space.

Definition at line 178 of file queue.hpp.

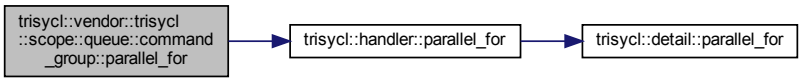
```
00179                                {
00180       cgh.parallel_for<KernelName>(num_work_items,
00181                                    [=, *this] (::trisycl::id<Rank> i) mutable {
00182                                      k(i, *this);
00183                                    });
00184     }
```

References i, and trisycl::handler::parallel_for().

Here is the call graph for this function:

12.11.3.6 parallel_for() [2/2]

```
template<typename Device , typename QueueStorage = empty_queue_scope>
template<typename CGH >
template<typename KernelName , int Rank, typename Kernel >
void trisycl::vendor::trisycl::scope::queue< Device, QueueStorage >::command_group< CGH >↩
::parallel_for (
             ::trisycl::range< Rank > num_work_items,
             Kernel k )  [inline]
```



Parallel kernel invocation method on a range iteration space.

Definition at line 178 of file queue.hpp.

```
00179                                {
00180       cgh.parallel_for<KernelName>(num_work_items,
00181                                    [=, *this] (::trisycl::id<Rank> i) mutable {
00182                                      k(i, *this);
00183                                    });
00184     }
```

References i, and trisycl::handler::parallel_for().

Here is the call graph for this function:

12.11.3.7 platform_scope() [1/2]

```
template<typename Device , typename QueueStorage = empty_queue_scope>
template<typename CGH >
template<typename PS = std::remove_reference_t<decltype(d.get_platform())>, typename E =
std::enable_if_t<PS::has_some_storage_p>>
auto & trisycl::vendor::trisycl::scope::queue< Device, QueueStorage >::command_group< CGH >↩
::platform_scope ( )  [inline]
```

Provide access to the platform scope from inside the kernel, if any.

Definition at line 194 of file queue.hpp.

```
00194 { return d.get_platform().get_storage(); }
```

12.11.3.8 platform_scope() [2/2]

```
template<typename Device , typename QueueStorage = empty_queue_scope>
template<typename CGH >
template<typename PS = std::remove_reference_t<decltype(d.get_platform())>, typename E =
std::enable_if_t<PS::has_some_storage_p>>
auto & trisycl::vendor::trisycl::scope::queue< Device, QueueStorage >::command_group< CGH >↩
::platform_scope ( )  [inline]
```

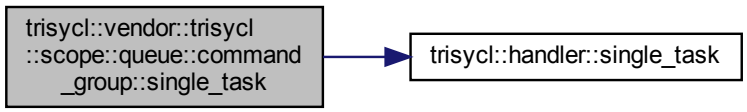
Provide access to the platform scope from inside the kernel, if any.

Definition at line 194 of file queue.hpp.

```
00194 { return d.get_platform().get_storage(); }
```

12.11.3.9 single_task() [1/2]

```
template<typename Device , typename QueueStorage = empty_queue_scope>
template<typename CGH >
template<typename KernelName , typename Kernel >
void trisycl::vendor::trisycl::scope::queue< Device, QueueStorage >::command_group< CGH >↩
::single_task (
             Kernel k )  [inline]
```



Sequential kernel invocation.

Definition at line 169 of file queue.hpp.

```
00169                                {
00170       cgh.single_task<KernelName>([=, *this] () mutable {
00171           k(*this);
00172         });
00173     }
```

References trisycl::handler::single_task().

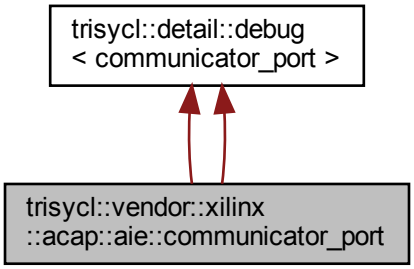
12.12 trisycl::vendor::xilinx::acap::aie::communicator_port Class Reference



Abstract interface for a communication port.

`#include <connection.hpp>`

Inheritance diagram for trisycl::vendor::xilinx::acap::aie::communicator_port:

Collaboration diagram for trisycl::vendor::xilinx::acap::aie::communicator_port:

Public Member Functions

- virtual void write (const axi_packet &)=0

  Enqueue a packet on the communicator input.
- auto & operator<< (const axi_packet::value_type &v)

  Alias to enqueue a packet on the communicator input.
- virtual bool try_write (const axi_packet &)=0

  Try to enqueue a packet to input.
- virtual axi_packet::value_type read ()=0

  Waiting read to a core input port.
- virtual bool try_read (axi_packet::value_type &)=0

  Non-blocking read from a communicator output port.
- template<typename T >
  auto & operator>> (T &v)

  Alias to the waiting read to a communicator output port.
- virtual ~communicator_port ()=default

  Nothing specific to do but need a virtual destructor to avoid slicing.
- virtual void write (const axi_packet &)=0

  Enqueue a packet on the communicator input.
- auto & operator<< (const axi_packet::value_type &v)

  Alias to enqueue a packet on the communicator input.
- virtual bool try_write (const axi_packet &)=0

  Try to enqueue a packet to input.
- virtual axi_packet::value_type read ()=0

  Waiting read to a core input port.
- virtual bool try_read (axi_packet::value_type &)=0

  Non-blocking read from a communicator output port.
- template<typename T >
  auto & operator>> (T &v)

  Alias to the waiting read to a communicator output port.
- virtual ~communicator_port ()=default

  Nothing specific to do but need a virtual destructor to avoid slicing.

Additional Inherited Members

12.12.1 Detailed Description

Abstract interface for a communication port.

For example a router output is actually implemented as an input to some other consumer (router, core...).

Definition at line 67 of file connection.hpp.

12.12.2 Constructor & Destructor Documentation

12.12.2.1 ~communicator_port() [1/2]

```
virtual trisycl::vendor::xilinx::acap::aie::communicator_port::~communicator_port ( )  [virtual],
[default]
```

Nothing specific to do but need a virtual destructor to avoid slicing.

12.12.2.2 ~communicator_port() [2/2]

```
virtual trisycl::vendor::xilinx::acap::aie::communicator_port::~communicator_port ( )  [virtual],
[default]
```

Nothing specific to do but need a virtual destructor to avoid slicing.

12.13 trisycl::vendor::xilinx::partition::complete< PDim > Struct Template Reference

Represent a complete partition.

```
#include <partition_array.hpp>
```

Collaboration diagram for trisycl::vendor::xilinx::partition::complete< PDim >:

Static Public Attributes

- static constexpr auto partition_dim = PDim
- static constexpr auto partition_type = type::complete

12.13.1 Detailed Description

template<std::size_t PDim = 1>
struct trisycl::vendor::xilinx::partition::complete< PDim >

Represent a complete partition.

The single array would be partitioned into individual elements. That is if we have a 4-element array with one dimension, the array is completely partitioned into distributed RAM or 4 independent registers.

Parameters

PDim	is the dimension that user wants to apply complete partition on. If PDim is 0, all dimensions will be completely partitioned.

Todo Deal with multi-dimension array. Now, since we can only deal with 1-dim, PDim is set to 1 by default.

The single array would be partitioned into individual elements. That is if we have a 4-element array with one dimension, the array is completely partitioned into distributed RAM or 4 independent registers.

Parameters

PDim	is the dimension that user wants to apply complete partition on. If PDim is 0, all dimensions will be completely partitioned.

Todo Deal with multi-dimension array. Now, since we can only deal with 1-dim, PDim is set to 1 by default.

Definition at line 119 of file partition_array.hpp.

12.13.2 Member Data Documentation

12.13.2.1 partition_dim

```
template<std::size_t PDim = 1>
static constexpr auto trisycl::vendor::xilinx::partition::complete< PDim >::partition_dim =
PDim  [static], [constexpr]
```

Definition at line 120 of file partition_array.hpp.

12.13.2.2 partition_type

```
template<std::size_t PDim = 1>
static constexpr auto trisycl::vendor::xilinx::partition::complete< PDim >::partition_type =
type::complete  [static], [constexpr]
```

Definition at line 121 of file partition_array.hpp.

12.14 trisycl::vendor::xilinx::acap::aie::connection Struct Reference

A connection between some AXI Stream Switch.

```
#include <connection.hpp>
```

Collaboration diagram for trisycl::vendor::xilinx::acap::aie::connection:

Classes

- struct base

  Base class of connection port.
- struct input

  Abstract an input port.
- struct output

  Abstract an output port.

Public Member Functions

- template<typename Pipe >
  connection (Pipe &&pipe)

  Create a connection.
- auto in ()

  Get the input port of this connection.
- auto out ()

  Get the output port of this connection.
- template<typename Pipe >
  connection (Pipe &&pipe)

  Create a connection.
- auto in ()

  Get the input port of this connection.
- auto out ()

  Get the output port of this connection.

Public Attributes

- std::shared_ptr< std::any > p

  The concrete communication media with some type erasure.

12.14.1 Detailed Description

A connection between some AXI Stream Switch.

Definition at line 260 of file connection.hpp.

12.14.2 Constructor & Destructor Documentation

12.14.2.1 connection() [1/2]

```
template<typename Pipe >
trisycl::vendor::xilinx::acap::aie::connection::connection (
            Pipe && pipe )  [inline]
```

Create a connection.

Parameters

in	*pipe*	is the communication media to be used

Definition at line 269 of file connection.hpp.

```
00270     :  p { new std::any { std::forward<Pipe>(pipe) } } {}
```

12.14.2.2 connection() [2/2]

```
template<typename Pipe >
trisycl::vendor::xilinx::acap::aie::connection::connection (
            Pipe && pipe )  [inline]
```

Create a connection.

Parameters

in	*pipe*	is the communication media to be used

Definition at line 269 of file connection.hpp.

```
00270     :  p { new std::any { std::forward<Pipe>(pipe) } } {}
```

12.14.3 Member Function Documentation

12.14.3.1 in() [1/2]

```
auto trisycl::vendor::xilinx::acap::aie::connection::in ( )  [inline]
```

Get the input port of this connection.

Definition at line 274 of file connection.hpp.

```
00274             {
00275     return input { *this };
00276   }
```

12.14.3.2 in() [2/2]

```
auto trisycl::vendor::xilinx::acap::aie::connection::in ( )  [inline]
```

Get the input port of this connection.

Definition at line 274 of file connection.hpp.

```
00274             {
00275     return input { *this };
00276   }
```

12.14.3.3 out() [1/2]

```
auto trisycl::vendor::xilinx::acap::aie::connection::out ( )  [inline]
```

Get the output port of this connection.

Definition at line 280 of file connection.hpp.

```
00280             {
00281     return output { *this };
00282   }
```

12.14.3.4 out() [2/2]

```
auto trisycl::vendor::xilinx::acap::aie::connection::out ( )  [inline]
```

Get the output port of this connection.

Definition at line 280 of file connection.hpp.

```
00280             {
00281     return output { *this };
00282   }
```

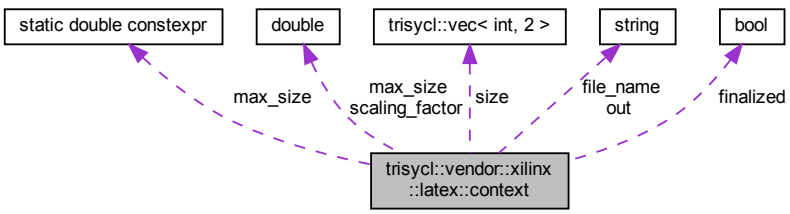
12.14.4 Member Data Documentation

12.14.4.1 p

```
std::shared_ptr< std::any > trisycl::vendor::xilinx::acap::aie::connection::p
```

The concrete communication media with some type erasure.

Definition at line 262 of file connection.hpp.



The documentation for this struct was generated from the following files:

- include/sycl/vendor/Xilinx/acap/aie/connection.hpp
- include/triSYCL/vendor/Xilinx/acap/aie/connection.hpp

12.15 trisycl::vendor::xilinx::latex::context Class Reference

```
#include <latex.hpp>
```

Collaboration diagram for trisycl::vendor::xilinx::latex::context:

Public Member Functions

- context (const vec< int, 2 > &s, const std::string &f_name={})

  Create a graphics context.
- void add (const std::string &content)

  Add textual LaTeX content to the context.
- double scale (double v) const
- void display ()

  Display the content.
- context (const vec< int, 2 > &s, const std::string &f_name={})

  Create a graphics context.
- void add (const std::string &content)

  Add textual LaTeX content to the context.
- double scale (double v) const
- void display ()

  Display the content.

Static Public Member Functions

- static std::string clean_node (const std::string_view &node_name, const std::string_view &prefix="")

  Build a TikZ/PGF valid name string by concatenating a prefix and a capitalized node name after having removed any '_'.
- static std::string clean_node (const std::string_view &node_name, const std::string_view &prefix="")

  Build a TikZ/PGF valid name string by concatenating a prefix and a capitalized node name after having removed any '_'.

Public Attributes

- double scaling_factor

  Scale all the coordinates by this factor to be under the TeX max size.
- vec< int, 2 > size

  Size of the drawing in the original units (unscaled)
- std::string file_name

  Name of the file to write into.
- std::string out

  Store the LaTeX output.
- bool finalized = false

  Keep track whether the content is finalized for final user consumption.

Static Public Attributes

- static double constexpr max_size = 574

Private Member Functions

- void finalize ()

  Finalize the content before using it.
- void finalize ()

  Finalize the content before using it.

12.15.1 Detailed Description

Definition at line 32 of file latex.hpp.

12.15.2 Constructor & Destructor Documentation

12.15.2.1 context() [1/2]

```
trisycl::vendor::xilinx::latex::context::context (
            const vec< int, 2 > & s,
            const std::string & f_name = {} )  [inline]
```

Create a graphics context.

Parameters

in	*s*	is the 2D size of the drawing to be generated in mm
in	*f_name*	is the file name of the LaTeX to be generated into or standard output by default

Definition at line 61 of file latex.hpp.

```
00061                                                       {})
00062     :  size { s }, file_name { f_name } {
00063     // Compute the scaling factor to remain under the TeX limit
00064     auto m = std::max(size.x(), size.y());
00065     scaling_factor = m > max_size ?  max_size/m :  1;
00066     // Generate the LaTeX header
00067     out = (boost::format { R"(%% To be compiled with lualatex instead of pdflatex
00068 %% to avoid a bug on _ and to handle huge memory automatically.
```

12.15.2.2 context() [2/2]

```
trisycl::vendor::xilinx::latex::context::context (
            const vec< int, 2 > & s,
            const std::string & f_name = {} )  [inline]
```

Create a graphics context.

Parameters

in	*s*	is the 2D size of the drawing to be generated in mm
in	*f_name*	is the file name of the LaTeX to be generated into or standard output by default

Definition at line 61 of file latex.hpp.

```
00061                                                       {})
00062     :  size { s }, file_name { f_name } {
00063     // Compute the scaling factor to remain under the TeX limit
00064     auto m = std::max(size.x(), size.y());
00065     scaling_factor = m > max_size ?  max_size/m :  1;
00066     // Generate the LaTeX header
```

```
00067     out = (boost::format { R"(%% To be compiled with lualatex instead of pdflatex
00068 %% to avoid a bug on _ and to handle huge memory automatically.
```

12.15.3 Member Function Documentation

12.15.3.1 add() [1/2]

```
void trisycl::vendor::xilinx::latex::context::add (
             const std::string & content )  [inline]
```

Add textual LaTeX content to the context.

Definition at line 72 of file latex.hpp.

```
00072                     {geometry}
00073 %% Use a font allowing arbitrary size
00074 \usepackage{lmodern}
```

12.15.3.2 add() [2/2]

```
void trisycl::vendor::xilinx::latex::context::add (
             const std::string & content )  [inline]
```

Add textual LaTeX content to the context.

Definition at line 72 of file latex.hpp.

```
00072                     {geometry}
00073 %% Use a font allowing arbitrary size
00074 \usepackage{lmodern}
```

12.15.3.3 clean_node() [1/2]

```
static std::string trisycl::vendor::xilinx::latex::context::clean_node (
             const std::string_view & node_name,
             const std::string_view & prefix = "" )  [inline], [static]
```

Build a TikZ/PGF valid name string by concatenating a prefix and a capitalized node name after having removed any '_'.

\input[in] node_name is a string-like TikZ/PGF that may contain some '_'

\input[in] prefix is an optional string-like prefix

Definition at line 118 of file latex.hpp.

```
00120                   {
00121     if (!finalized) {
00122       // Add the LaTeX epilogue
00123       out += R"(
00124 \end{tikzpicture}
00125
00126 \end{document})";
00127 }
00128 }
00129
00130 public:
```

References finalized, and out.

12.15.3.4 clean_node() [2/2]

```
static std::string trisycl::vendor::xilinx::latex::context::clean_node (
            const std::string_view & node_name,
            const std::string_view & prefix = "" )  [inline], [static]
```

Build a TikZ/PGF valid name string by concatenating a prefix and a capitalized node name after having removed any '_'.

\input[in] node_name is a string-like TikZ/PGF that may contain some '_'

\input[in] prefix is an optional string-like prefix

Definition at line 118 of file latex.hpp.

```
00120                 {
00121     if (!finalized) {
00122       // Add the LaTeX epilogue
00123       out += R"(
00124 \end{tikzpicture}
00125
00126 \end{document})";
00127 }
00128 }
00129
00130 public:
```

References finalized, and out.

12.15.3.5 display() [1/2]

```
void trisycl::vendor::xilinx::latex::context::display ( )  [inline]
```

Display the content.

Display the LaTeX textual content on or into a file, to be compiled for example with lualatex

Definition at line 102 of file latex.hpp.

```
00107                                 {
00108     out += content;
```

12.15.3.6 display() [2/2]

```
void trisycl::vendor::xilinx::latex::context::display ( )  [inline]
```

Display the content.

Display the LaTeX textual content on or into a file, to be compiled for example with lualatex

Definition at line 102 of file latex.hpp.

```
00107                                 {
00108     out += content;
```

12.15.3.7 finalize() [1/2]

```
void trisycl::vendor::xilinx::latex::context::finalize ( )  [inline], [private]
```

Finalize the content before using it.

Definition at line 85 of file latex.hpp.

```
00086       {document}
00087 %% No page number, header or footer
00088 \thispagestyle{empty}
00089 %% Skip the usual space at the beginning of a paragraph
00090 \noindent
00091 %% Use a super small font.  Use sans-serif for readability
00092 \fontsize{%3%}{%3%}\selectfont\sffamily
00093 %% Use remembering in every picture so we can use named coordinates
```

12.15.3.8 finalize() [2/2]

```
void trisycl::vendor::xilinx::latex::context::finalize ( )  [inline], [private]
```

Finalize the content before using it.

Definition at line 85 of file latex.hpp.

```
00086       {document}
00087 %% No page number, header or footer
00088 \thispagestyle{empty}
00089 %% Skip the usual space at the beginning of a paragraph
00090 \noindent
00091 %% Use a super small font.  Use sans-serif for readability
00092 \fontsize{%3%}{%3%}\selectfont\sffamily
00093 %% Use remembering in every picture so we can use named coordinates
```

12.15.3.9 scale() [1/2]

```
double trisycl::vendor::xilinx::latex::context::scale (
            double v ) const  [inline]
```

Definition at line 78 of file latex.hpp.

```
00078           {tikzlings}
00079 \definecolor{orangeSYCL}{RGB}{242,104,34}
00080 %% Some cool palettes
```

12.15.3.10 scale() [2/2]

```
double trisycl::vendor::xilinx::latex::context::scale (
            double v ) const  [inline]
```

Definition at line 78 of file latex.hpp.

```
00078           {tikzlings}
00079 \definecolor{orangeSYCL}{RGB}{242,104,34}
00080 %% Some cool palettes
```

12.15.4 Member Data Documentation

12.15.4.1 file_name

```
std::string trisycl::vendor::xilinx::latex::context::file_name
```

Name of the file to write into.

Definition at line 46 of file latex.hpp.

12.15.4.2 finalized

```
bool trisycl::vendor::xilinx::latex::context::finalized = false
```

Keep track whether the content is finalized for final user consumption.

Definition at line 52 of file latex.hpp.

Referenced by clean_node().

12.15.4.3 max_size

```
double constexpr trisycl::vendor::xilinx::latex::context::max_size = 574  [static], [constexpr]
```

Definition at line 37 of file latex.hpp.

12.15.4.4 out

```
std::string trisycl::vendor::xilinx::latex::context::out
```

Store the LaTeX output.

Definition at line 49 of file latex.hpp.

Referenced by clean_node().

12.15.4.5 scaling_factor

```
double trisycl::vendor::xilinx::latex::context::scaling_factor
```

Scale all the coordinates by this factor to be under the TeX max size.

Definition at line 40 of file latex.hpp.

12.15.4.6 size

```
vec<int, 2> trisycl::vendor::xilinx::latex::context::size
```

Size of the drawing in the original units (unscaled)

Definition at line 43 of file latex.hpp.

Layout of the AXI stream slave ports in the switch.

Static Public Attributes

- static auto constexpr latency = 4

Default number of registers on default router paths.

- static auto constexpr fifo_depth = 16

Depth of additional FIFO on specific FIFO paths.

- static constexpr auto nb_master_port

Number of AXI stream master ports in the switch.

- static auto m_me_range

A range of the master ports connected to the tile inputs.

- static constexpr auto m_me_size

Number of master ports connected to the tile inputs.

- static auto m_dma_range

A range of the master ports connected to the DMA inputs.

- static constexpr auto m_dma_size

Number of master ports connected to the DMA inputs.

- static auto m_tile_ctrl_range

A range of the master ports connected to the tile control inputs.

- static constexpr auto m_tile_ctrl_size

Number of master ports connected to the tile control inputs.

- static auto m_fifo_range

A range of the master ports connected to the FIFO inputs.

- static constexpr auto m_fifo_size

Number of master ports connected to the FIFO inputs.

- static auto m_south_range

A range of the South master ports.

- static constexpr auto m_south_size

Number of South master ports.

- static auto m_west_range

  A range of the West master ports.
- static constexpr auto m_west_size

  Number of West master ports.
- static auto m_north_range

  A range of the North master ports.
- static constexpr auto m_north_size

  Number of North master ports.
- static auto m_east_range

  A range of the East master ports.
- static constexpr auto m_east_size

  Number of East master ports.
- static constexpr auto nb_slave_port

  Number of AXI stream slave ports in the switch.
- static auto s_me_range

  A range of the slave ports connected to the tile outputs.
- static constexpr auto s_me_size

  Number of slave ports connected to the tile outputs.
- static auto s_dma_range

  A range of the slave ports connected to the DMA outputs.
- static constexpr auto s_dma_size

  Number of slave ports connected to the DMA outputs.
- static auto s_tile_ctrl_range

  A range of the slave ports connected to the tile control outputs.
- static constexpr auto s_tile_ctrl_size

  Number of slave ports connected to the tile control outputs.
- static auto s_fifo_range

  A range of the slave ports connected to the FIFO outputs.
- static constexpr auto s_fifo_size

  Number of slave ports connected to the FIFO outputs.
- static auto s_south_range

  A range of the South slave ports.
- static constexpr auto s_south_size

  Number of South slave ports.
- static auto s_west_range

  A range of the West slave ports.
- static constexpr auto s_west_size

  Number of West slave ports.
- static auto s_north_range

  A range of the North slave ports.
- static constexpr auto s_north_size

  Number of North slave ports.
- static auto s_east_range

  A range of the East slave ports.
- static constexpr auto s_east_size

  Number of East slave ports.
- static auto interconnect

  Describe the AXI stream switch interconnection neighborhood.

Friends

- bool constexpr is_axi_master (master_port_layout)

  Use a hidden friend to have introspection for master_port_layout.
- bool constexpr is_axi_master (slave_port_layout)

  Use a hidden friend to have introspection for slave_port_layout.
- bool constexpr is_axi_master (master_port_layout)

  Use a hidden friend to have introspection for master_port_layout.
- bool constexpr is_axi_master (slave_port_layout)

  Use a hidden friend to have introspection for slave_port_layout.

12.16.3 Friends And Related Function Documentation

12.16.3.1 is_axi_master [1/4]

```
template<typename Layout >
bool constexpr is_axi_master (
            master_port_layout  )  [friend]
```

Use a hidden friend to have introspection for master_port_layout.

Definition at line 408 of file geography.hpp.

```
00408                                                       {
00409       // Yes, master_port_layout is definitely an AXI master
00410       return true;
00411     }
```

12.16.3.2 is_axi_master [2/4]

```
template<typename Layout >
bool constexpr is_axi_master (
            master_port_layout  )  [friend]
```

Use a hidden friend to have introspection for master_port_layout.

Definition at line 408 of file geography.hpp.

```
00408                                                       {
00409       // Yes, master_port_layout is definitely an AXI master
00410       return true;
00411     }
```

12.16.3.3 is_axi_master [3/4]

```
template<typename Layout >
bool constexpr is_axi_master (
            slave_port_layout  )  [friend]
```

Use a hidden friend to have introspection for slave_port_layout.

Definition at line 536 of file geography.hpp.

```
00536                                                      {
00537       // No, slave_port_layout is definitely not an AXI master
00538       return false;
00539     }
```

12.16.3.4 is_axi_master [4/4]

```
template<typename Layout >
bool constexpr is_axi_master (
            slave_port_layout  )  [friend]
```

Use a hidden friend to have introspection for slave_port_layout.

Definition at line 536 of file geography.hpp.

```
00536                                                      {
00537       // No, slave_port_layout is definitely not an AXI master
00538       return false;
00539     }
```

12.16.4 Member Data Documentation

12.16.4.1 fifo_depth

```
template<typename Layout >
static auto constexpr trisycl::vendor::xilinx::acap::aie::geography< Layout >::core_axi_↩
stream_switch::fifo_depth = 16  [static], [constexpr]
```

Depth of additional FIFO on specific FIFO paths.

Definition at line 370 of file geography.hpp.

12.16.4.2 interconnect

```
template<typename Layout >
static auto trisycl::vendor::xilinx::acap::aie::geography< Layout >::core_axi_stream_switch↩
::interconnect  [inline], [static]
```

Initial value:

```
= boost::hana::make_tuple(

        std::tuple { 1, 0, m_east_range, s_west_range }

      , std::tuple { -1, 0, m_west_range, s_east_range }

      , std::tuple { 0, 1, m_north_range, s_south_range }

      , std::tuple { 0, -1, m_south_range, s_north_range }
      )
```

Describe the AXI stream switch interconnection neighborhood.

Definition at line 621 of file geography.hpp.

Referenced by trisycl::vendor::xilinx::acap::aie::detail::device< Layout >::for_each_tile_neighborhood().

12.16.4.3 latency

```
template<typename Layout >
static auto constexpr trisycl::vendor::xilinx::acap::aie::geography< Layout >::core_axi_↩
stream_switch::latency = 4  [static], [constexpr]
```

Default number of registers on default router paths.

Definition at line 367 of file geography.hpp.

12.16.4.4 m_dma_range

```
template<typename Layout >
static auto trisycl::vendor::xilinx::acap::aie::geography< Layout >::core_axi_stream_switch↩
::m_dma_range  [inline], [static]
```

Initial value:

```
=
      views::enum_type(master_port_layout::dma_0, master_port_layout::dma_last)
```

A range of the master ports connected to the DMA inputs.

Definition at line 430 of file geography.hpp.

12.16.4.5 m_dma_size

```
template<typename Layout >
static constexpr auto trisycl::vendor::xilinx::acap::aie::geography< Layout >::core_axi_↩
stream_switch::m_dma_size  [static], [constexpr]
```

Initial value:

```
=
      detail::enum_count(master_port_layout::dma_0,
                         master_port_layout::dma_last)
```

Number of master ports connected to the DMA inputs.

Definition at line 434 of file geography.hpp.

12.16.4.6 m_east_range

```
template<typename Layout >
static auto trisycl::vendor::xilinx::acap::aie::geography< Layout >::core_axi_stream_switch↩
::m_east_range  [inline], [static]
```

Initial value:

```
=
      views::enum_type(master_port_layout::east_0,
                       master_port_layout::east_last)
```

A range of the East master ports.

Definition at line 489 of file geography.hpp.

12.16.4.7 m_east_size

```
template<typename Layout >
static constexpr auto trisycl::vendor::xilinx::acap::aie::geography< Layout >::core_axi_↩
stream_switch::m_east_size  [static], [constexpr]
```

Initial value:

```
=
      detail::enum_count(master_port_layout::east_0,
                         master_port_layout::east_last)
```

Number of East master ports.

Definition at line 494 of file geography.hpp.

12.16.4.8 m_fifo_range

```
template<typename Layout >
static auto trisycl::vendor::xilinx::acap::aie::geography< Layout >::core_axi_stream_switch↩
::m_fifo_range  [inline], [static]
```

Initial value:

```
=
      views::enum_type(master_port_layout::fifo_0,
                       master_port_layout::fifo_last)
```

A range of the master ports connected to the FIFO inputs.

Definition at line 449 of file geography.hpp.

12.16.4.9 m_fifo_size

```
template<typename Layout >
static constexpr auto trisycl::vendor::xilinx::acap::aie::geography< Layout >::core_axi_↩
stream_switch::m_fifo_size  [static], [constexpr]
```

Initial value:

```
=
      detail::enum_count(master_port_layout::fifo_0,
                         master_port_layout::fifo_last)
```

Number of master ports connected to the FIFO inputs.

Definition at line 454 of file geography.hpp.

12.16.4.10 m_me_range

```
template<typename Layout >
static auto trisycl::vendor::xilinx::acap::aie::geography< Layout >::core_axi_stream_switch↩
::m_me_range  [inline], [static]
```

Initial value:

```
=
      views::enum_type(master_port_layout::me_0, master_port_layout::me_last)
```

A range of the master ports connected to the tile inputs.

Definition at line 422 of file geography.hpp.

12.16.4.11 m_me_size

```
template<typename Layout >
static constexpr auto trisycl::vendor::xilinx::acap::aie::geography< Layout >::core_axi_↩
stream_switch::m_me_size  [static], [constexpr]
```

Initial value:

```
=
      detail::enum_count(master_port_layout::me_0, master_port_layout::me_last)
```

Number of master ports connected to the tile inputs.

Definition at line 426 of file geography.hpp.

12.16.4.12 m_north_range

```
template<typename Layout >
static auto trisycl::vendor::xilinx::acap::aie::geography< Layout >::core_axi_stream_switch↩
::m_north_range  [inline], [static]
```

Initial value:

```
=
      views::enum_type(master_port_layout::north_0,
                       master_port_layout::north_last)
```

A range of the North master ports.

Definition at line 479 of file geography.hpp.

12.16.4.13 m_north_size

```
template<typename Layout >
static constexpr auto trisycl::vendor::xilinx::acap::aie::geography< Layout >::core_axi_↩
stream_switch::m_north_size  [static], [constexpr]
```

Initial value:

```
=
      detail::enum_count(master_port_layout::north_0,
                         master_port_layout::north_last)
```

Number of North master ports.

Definition at line 484 of file geography.hpp.

12.16.4.14 m_south_range

```
template<typename Layout >
static auto trisycl::vendor::xilinx::acap::aie::geography< Layout >::core_axi_stream_switch↩
::m_south_range  [inline], [static]
```

Initial value:

```
=
      views::enum_type(master_port_layout::south_0,
                       master_port_layout::south_last)
```

A range of the South master ports.

Definition at line 459 of file geography.hpp.

12.16.4.15 m_south_size

```
template<typename Layout >
static constexpr auto trisycl::vendor::xilinx::acap::aie::geography< Layout >::core_axi_↩
stream_switch::m_south_size  [static], [constexpr]
```

Initial value:

```
=
      detail::enum_count(master_port_layout::south_0,
                         master_port_layout::south_last)
```

Number of South master ports.

Definition at line 464 of file geography.hpp.

12.16.4.16 m_tile_ctrl_range

```
template<typename Layout >
static auto trisycl::vendor::xilinx::acap::aie::geography< Layout >::core_axi_stream_switch↩
::m_tile_ctrl_range  [inline], [static]
```

Initial value:

```
=
      views::enum_type(master_port_layout::tile_ctrl,

12.17 trisycl::vendor::xilinx::partition::cyclic< PhyMemNum, PDim > Struct Template Reference

Represent a cyclic partition.

`#include <partition_array.hpp>`

Collaboration diagram for trisycl::vendor::xilinx::partition::cyclic< PhyMemNum, PDim >:

Static Public Attributes

- static constexpr auto physical_mem_num = PhyMemNum
- static constexpr auto partition_dim = PDim
- static constexpr auto partition_type = type::cyclic

12.17.1 Detailed Description

template<std::size_t PhyMemNum = 1, std::size_t PDim = 1>
struct trisycl::vendor::xilinx::partition::cyclic< PhyMemNum, PDim >

Represent a cyclic partition.

The single array would be partitioned into several small physical memories in this case. These small physical memories can be accessed simultaneously which drive the performance. Each element in the array would be partitioned to each memory in order and cyclically.

That is if we have a 4-element array which contains 4 integers 0, 1, 2, and 3. If we set factor to 2, and partition dimension to 1 for this cyclic partition array. Then, the contents of this array will be distributed to 2 physical memories: one contains 1, 3 and the other contains 2,4.

Parameters

PhyMemNum	is the number of physical memories that user wants to have.
PDim	is the dimension that user wants to apply cyclic partition on. If PDim is 0, all dimensions will be partitioned with cyclic order.

Todo Deal with multi-dimension array. Now, since we can only deal with 1-dim, PDim is set to 1 by default.

The single array would be partitioned into several small physical memories in this case. These small physical memories can be accessed simultaneously which drive the performance. Each element in the array would be partitioned to each memory in order and cyclically.

That is if we have a 4-element array which contains 4 integers 0, 1, 2, and 3. If we set factor to 2, and partition dimension to 1 for this cyclic partition array. Then, the contents of this array will be distributed to 2 physical memories: one contains 1, 3 and the other contains 2,4.

12.19 trisycl::vendor::xilinx::acap::aie::detail::device< Layout > Struct Template Reference

Create a SYCL-like device view of an AI Engine CGRA with some layout.

`#include <device.hpp>`

Collaboration diagram for trisycl::vendor::xilinx::acap::aie::detail::device< Layout >:

Public Types

- using geo = geography< Layout >

  The geography of the CGRA.
- using cass = typename geo::core_axi_stream_switch

  Naming shortcut for the core AXI stream switch.
- using csp = typename cass::slave_port_layout

  Naming shortcut for the slave ports of the core AXI stream switch.
- using cmp = typename cass::master_port_layout

  Naming shortcut for the master ports of the core AXI stream switch.
- using sass = typename geo::shim_axi_stream_switch

  Naming shortcut for the shim AXI stream switch.
- using ssp = typename sass::slave_port_layout

  Naming shortcut for the slave ports of the shim AXI stream switch.
- using smp = typename sass::master_port_layout

  Naming shortcut for the master ports of the shim AXI stream switch.
- using geo = geography< Layout >

  The geography of the CGRA.
- using cass = typename geo::core_axi_stream_switch

  Naming shortcut for the core AXI stream switch.

- using csp = typename cass::slave_port_layout

  Naming shortcut for the slave ports of the core AXI stream switch.
- using cmp = typename cass::master_port_layout

  Naming shortcut for the master ports of the core AXI stream switch.
- using sass = typename geo::shim_axi_stream_switch

  Naming shortcut for the shim AXI stream switch.
- using ssp = typename sass::slave_port_layout

  Naming shortcut for the slave ports of the shim AXI stream switch.
- using smp = typename sass::master_port_layout

  Naming shortcut for the master ports of the shim AXI stream switch.

Public Member Functions

- auto & tile (int x, int y)

  Access to the common infrastructure part of a tile.
- template<typename F >
  void for_each_tile_index (F &&f)

  Apply a function for each tile index of the device.
- template<typename F >
  void for_each_tile (F &&f)

  Apply a function for each tile infrastructure of the device.
- template<typename F >
  void for_each_tile_x_index (F &&f)

  Apply a function for each x tile index of the device.
- template<typename F >
  void for_each_tile_y_index (F &&f)

  Apply a function for each y tile index of the device.
- auto & mem (int x, int y)

  Shortcut to access to the common infrastructure part of a tile memory.
- auto & shim (int x)

  Access to the shim tile.
- auto & cascade ()

  Access the cascade connections.
- template<typename SrcPort , typename DstPort >
  void connect (SrcPort &&src, DstPort &&dst)

  Connect the ports of 2 tiles or shims together with an hyperspace switched circuit, jumping over the underlying routing infrastructure.
- template<typename F >
  void for_each_tile_neighborhood (F &&f)

  Apply a function on all the AXI stream of the neighborhood of each tile.
- device ()

  Build some device level infrastructure.
- auto display (const std::string &file_name={})

  Display the device layout.
- auto & tile (int x, int y)

  Access to the common infrastructure part of a tile.
- template<typename F >
  void for_each_tile_index (F &&f)

  Apply a function for each tile index of the device.
- template<typename F >
  void for_each_tile (F &&f)

Apply a function for each tile infrastructure of the device.

- template<typename F >
  void for_each_tile_x_index (F &&f)

  Apply a function for each x tile index of the device.
- template<typename F >
  void for_each_tile_y_index (F &&f)

  Apply a function for each y tile index of the device.
- auto & mem (int x, int y)

  Shortcut to access to the common infrastructure part of a tile memory.
- auto & shim (int x)

  Access to the shim tile.
- auto & cascade ()

  Access the cascade connections.
- template<typename SrcPort , typename DstPort >
  void connect (SrcPort &&src, DstPort &&dst)

  Connect the ports of 2 tiles or shims together with an hyperspace switched circuit, jumping over the underlying routing infrastructure.
- template<typename F >
  void for_each_tile_neighborhood (F &&f)

  Apply a function on all the AXI stream of the neighborhood of each tile.
- device ()

  Build some device level infrastructure.
- auto display (const std::string &file_name={})

  Display the device layout.

Public Attributes

- cascade_stream< geo > cs

  The cascade stream infrastructure of the CGRA.
- ::trisycl::detail::fiber_pool fiber_executor

  A fiber pool executor to run the infrastructure powered by TRISYCL_XILINX_AIE_FIBER_EXECUTOR_THREADS std::thread.
- aie::tile_infrastructure< geo > ti [geo::y_size][geo::x_size]

  Keep track of all the (non detail) infrastructure tiles of this device.
- shim_tile< device > shims [geo::x_size]

  The shim tiles on the lower row of the tile array.

12.19.1 Detailed Description

template<typename Layout>
struct trisycl::vendor::xilinx::acap::aie::detail::device< Layout >

Create a SYCL-like device view of an AI Engine CGRA with some layout.

Parameters

Layout	is the layout description of the machine to instantiate with the physical size

Definition at line 41 of file device.hpp.

12.19.2 Member Typedef Documentation

12.19.2.1 cass [1/2]

```
template<typename Layout >
using trisycl::vendor::xilinx::acap::aie::detail::device< Layout >::cass = typename geo::core_axi_stream_swit
```

Naming shortcut for the core AXI stream switch.

Definition at line 47 of file device.hpp.

12.19.2.2 cass [2/2]

```
template<typename Layout >
using trisycl::vendor::xilinx::acap::aie::detail::device< Layout >::cass = typename geo::core_axi_stream_swit
```

Naming shortcut for the core AXI stream switch.

Definition at line 47 of file device.hpp.

12.19.2.3 cmp [1/2]

```
template<typename Layout >
using trisycl::vendor::xilinx::acap::aie::detail::device< Layout >::cmp = typename cass↩
::master_port_layout
```

Naming shortcut for the master ports of the core AXI stream switch.

Definition at line 53 of file device.hpp.

12.19.2.4 cmp [2/2]

```
template<typename Layout >
using trisycl::vendor::xilinx::acap::aie::detail::device< Layout >::cmp = typename cass↩
::master_port_layout
```

Naming shortcut for the master ports of the core AXI stream switch.

Definition at line 53 of file device.hpp.

12.19.2.5 csp [1/2]

```
template<typename Layout >
using trisycl::vendor::xilinx::acap::aie::detail::device< Layout >::csp = typename cass↩
::slave_port_layout
```

Naming shortcut for the slave ports of the core AXI stream switch.

Definition at line 50 of file device.hpp.

12.19.2.6 csp [2/2]

```
template<typename Layout >
using trisycl::vendor::xilinx::acap::aie::detail::device< Layout >::csp = typename cass↩
::slave_port_layout
```

Naming shortcut for the slave ports of the core AXI stream switch.

Definition at line 50 of file device.hpp.

12.19.2.7 geo [1/2]

```
template<typename Layout >
using trisycl::vendor::xilinx::acap::aie::detail::device< Layout >::geo = geography<Layout>
```

The geography of the CGRA.

Definition at line 44 of file device.hpp.

12.19.2.8 geo [2/2]

```
template<typename Layout >
using trisycl::vendor::xilinx::acap::aie::detail::device< Layout >::geo = geography<Layout>
```

The geography of the CGRA.

Definition at line 44 of file device.hpp.

12.19.2.9 sass [1/2]

```
template<typename Layout >
using trisycl::vendor::xilinx::acap::aie::detail::device< Layout >::sass = typename geo::shim_axi_stream_swit
```

Naming shortcut for the shim AXI stream switch.

Definition at line 56 of file device.hpp.

12.19.2.10 sass [2/2]

```
template<typename Layout >
using trisycl::vendor::xilinx::acap::aie::detail::device< Layout >::sass = typename geo::shim_axi_stream_swit
```

Naming shortcut for the shim AXI stream switch.

Definition at line 56 of file device.hpp.

12.19.2.11 smp [1/2]

```
template<typename Layout >
using trisycl::vendor::xilinx::acap::aie::detail::device< Layout >::smp = typename sass↩
::master_port_layout
```

Naming shortcut for the master ports of the shim AXI stream switch.

Definition at line 62 of file device.hpp.

12.19.2.12 smp [2/2]

```
template<typename Layout >
using trisycl::vendor::xilinx::acap::aie::detail::device< Layout >::smp = typename sass↩
::master_port_layout
```

Naming shortcut for the master ports of the shim AXI stream switch.

Definition at line 62 of file device.hpp.

12.19.2.13 ssp [1/2]

```
template<typename Layout >
using trisycl::vendor::xilinx::acap::aie::detail::device< Layout >::ssp = typename sass↩
::slave_port_layout
```

Naming shortcut for the slave ports of the shim AXI stream switch.

Definition at line 59 of file device.hpp.

12.19.2.14 ssp [2/2]

```
template<typename Layout >
using trisycl::vendor::xilinx::acap::aie::detail::device< Layout >::ssp = typename sass↩
::slave_port_layout
```

Naming shortcut for the slave ports of the shim AXI stream switch.

Definition at line 59 of file device.hpp.

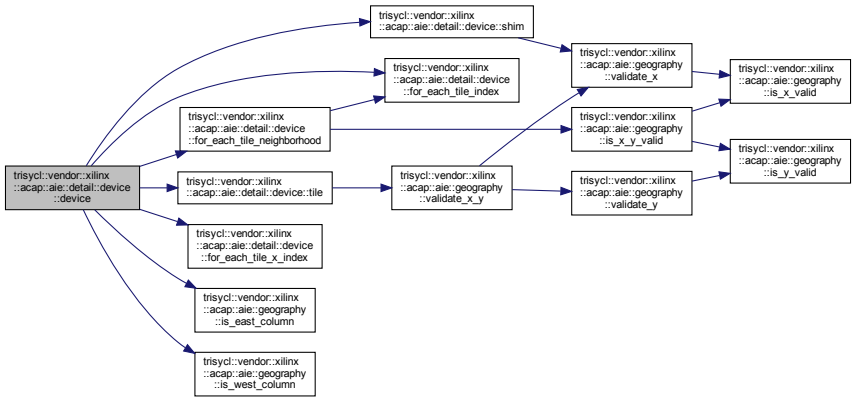
12.19.3 Constructor & Destructor Documentation

12.19.3.1 device() [1/2]

```
template<typename Layout >
trisycl::vendor::xilinx::acap::aie::detail::device< Layout >::device ( )  [inline]
```

Build some device level infrastructure.

Make the connections around the shim tiles



Definition at line 226 of file device.hpp.

```
00226       {
00227     // Initialize all the tiles with their network connections first
00228     for_each_tile_index([&](auto x, auto y) {
00229       // Create & start the tile infrastructure
00230       tile(x, y) = { x, y, *this, fiber_executor };
00231     });
00232     for_each_tile_x_index([&](auto x) {
00233       // Start the shim infrastructure

12.19.4 Member Function Documentation

12.19.4.1 cascade() [1/2]

```
template<typename Layout >
auto & trisycl::vendor::xilinx::acap::aie::detail::device< Layout >::cascade ( )  [inline]
```

Access the cascade connections.

Todo To remove?

Definition at line 165 of file device.hpp.

```
00165 { return cs; }
```

References trisycl::vendor::xilinx::acap::aie::detail::device< Layout >::cs.

12.19.4.2 cascade() [2/2]

```
template<typename Layout >
auto & trisycl::vendor::xilinx::acap::aie::detail::device< Layout >::cascade ( )  [inline]
```

Access the cascade connections.

Todo To remove?

Definition at line 165 of file device.hpp.

```
00165 { return cs; }
```

References trisycl::vendor::xilinx::acap::aie::detail::device< Layout >::cs.

12.19.4.3 connect() [1/2]

```
template<typename Layout >
template<typename SrcPort , typename DstPort >
void trisycl::vendor::xilinx::acap::aie::detail::device< Layout >::connect (
            SrcPort && src,
            DstPort && dst )  [inline]
```

Connect the ports of 2 tiles or shims together with an hyperspace switched circuit, jumping over the underlying routing infrastructure.

This is used to speed up communication in emulation and to skip the need of a routing planner.

Todo To deprecate and implement in another way?

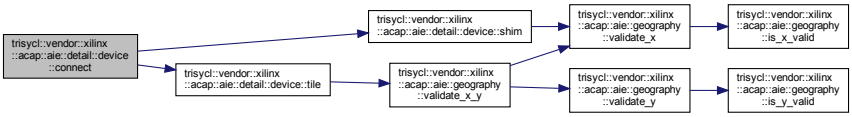
Parameters

in	*T*	is the type of the data to be transferred
in	*SrcPort*	is the type of the source port, such as port::tile or port::shim
in	*DstPort*	is the type of the destination port, such as port::tile or port::shim

Exceptions

trisycl::runtime_error	if some coordinates or port numbers are invalid

Todo Refactor, make the difference between user & physical ports



Definition at line 190 of file device.hpp.

```
00190                                          {

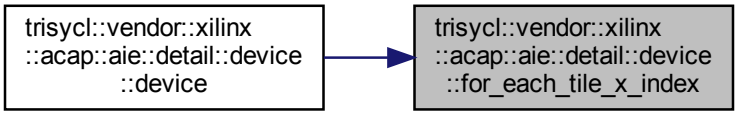
12.19.4.13 for_each_tile_x_index() [1/2]

```
template<typename Layout >
template<typename F >
void trisycl::vendor::xilinx::acap::aie::detail::device< Layout >::for_each_tile_x_index (
            F && f )  [inline]
```

Apply a function for each x tile index of the device.

Parameters

f	is a callable that is to be called like `f(x)` for each horizontal index value



Definition at line 119 of file device.hpp.

```
00119                                                                    {
00120     for (auto x :  ranges::views::iota(0, geo::x_size))
00121       f(x);
00122   };

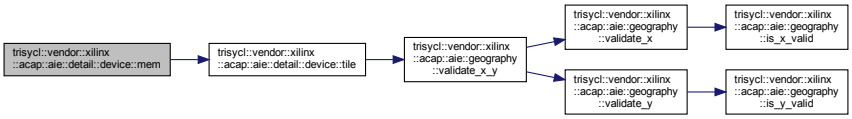
auto & trisycl::vendor::xilinx::acap::aie::detail::device< Layout >::mem (
            int x,
            int y )  [inline]
```

Shortcut to access to the common infrastructure part of a tile memory.

Parameters

in	*x*	is the horizontal tile coordinate
in	*y*	is the vertical tile coordinate

Exceptions



trisycl::runtime_error	if the coordinate is invalid

Definition at line 142 of file device.hpp.

```
00142                                {
00143     return tile(x, y).mem();

12.19.5 Member Data Documentation

12.19.5.1 cs

```
template<typename Layout >
cascade_stream<geo> trisycl::vendor::xilinx::acap::aie::detail::device< Layout >::cs
```

The cascade stream infrastructure of the CGRA.

Todo remove and distribute it instead

Todo remove and distribute it instead

Definition at line 66 of file device.hpp.

Referenced by trisycl::vendor::xilinx::acap::aie::detail::device< Layout >::cascade().

12.19.5.2 fiber_executor

```
template<typename Layout >
::trisycl::detail::fiber_pool trisycl::vendor::xilinx::acap::aie::detail::device< Layout >↩
::fiber_executor
```

Initial value:

```
{
    1, ::trisycl::detail::fiber_pool::sched::round_robin, false
  }
```

A fiber pool executor to run the infrastructure powered by TRISYCL_XILINX_AIE_FIBER_EXECUTOR_THREADS std::thread.

Definition at line 70 of file device.hpp.

Referenced by trisycl::vendor::xilinx::acap::aie::detail::device< Layout >::device().

12.19.5.3 shims

```
template<typename Layout >
shim_tile<device> trisycl::vendor::xilinx::acap::aie::detail::device< Layout >::shims[geo::x_size]
```

The shim tiles on the lower row of the tile array.

For now we consider only homogeneous shim tiles.

Definition at line 150 of file device.hpp.

Referenced by trisycl::vendor::xilinx::acap::aie::detail::device< Layout >::shim().

12.19.5.4 ti

```
template<typename Layout >
aie::tile_infrastructure<geo> trisycl::vendor::xilinx::acap::aie::detail::device< Layout >↩
::ti[geo::y_size][geo::x_size]
```

Keep track of all the (non detail) infrastructure tiles of this device.

Definition at line 78 of file device.hpp.

Referenced by trisycl::vendor::xilinx::acap::aie::detail::device< Layout >::tile().

The documentation for this struct was generated from the following files:

  Display the device layout.

Static Public Attributes

- static auto constexpr x_min = geo::x_min

  Minimum horizontal coordinate.
- static auto constexpr x_max = geo::x_max

  Maximum horizontal coordinate.
- static auto constexpr x_size = geo::x_size

  Number of tile horizontally in the CGRA.
- static auto constexpr y_min = geo::y_min

  Minimum vertical coordinate.
- static auto constexpr y_max = geo::y_max

  Maximum vertical coordinate.
- static auto constexpr y_size = geo::y_size

  Number of tile vertically in the CGRA.
- static auto constexpr size = geo::size

  Total number of tiles in the CGRA.

Private Types

- using dd = detail::device< Layout >

  The type encapsulating the implementation.
- using facade_t = facade::device< device< Layout >, dd >

  The façade used to implement part of the use facing type.
- using dd = detail::device< Layout >

  The type encapsulating the implementation.
- using facade_t = facade::device< device< Layout >, dd >

  The façade used to implement part of the use facing type.

Additional Inherited Members

12.20.1 Detailed Description

template<typename Layout>
class trisycl::vendor::xilinx::acap::aie::device< Layout >

Create a SYCL-like device view of an AI Engine CGRA with some layout.

Parameters

Layout	is the layout description of the machine to instantiate with the physical size

Definition at line 30 of file device.hpp.

12.20.2 Member Typedef Documentation

12.20.2.1 cass [1/2]

```
template<typename Layout >

```

Definition at line 48 of file device.hpp.

12.20.3 Constructor & Destructor Documentation

12.20.3.1 device() [1/2]

```
template<typename Layout >
trisycl::vendor::xilinx::acap::aie::device< Layout >::device ( )  [inline]
```

The default constructor makes a new device.

Definition at line 75 of file device.hpp.

```
00076       :  facade_t { std::make_shared<dd>() } {}
```

12.20.3.2 device() [2/2]

```
template<typename Layout >
trisycl::vendor::xilinx::acap::aie::device< Layout >::device ( )  [inline]
```

The default constructor makes a new device.

Definition at line 75 of file device.hpp.
```
00076       :  facade_t { std::make_shared<dd>() } {}
```

12.20.4 Member Function Documentation

12.20.4.1 cascade() [1/2]

```
template<typename Layout >
auto & trisycl::vendor::xilinx::acap::aie::device< Layout >::cascade ( )  [inline]
```

Access the cascade connections.

Todo To remove?

Definition at line 144 of file device.hpp.
```
00144 { return implementation->cascade(); }
```

References trisycl::detail::shared_ptr_implementation< device< Layout >, detail::device< Layout > >::implementation.

12.20.4.2 cascade() [2/2]

```
template<typename Layout >
auto & trisycl::vendor::xilinx::acap::aie::device< Layout >::cascade ( )  [inline]
```

Access the cascade connections.

Todo To remove?

Definition at line 144 of file device.hpp.
```
00144 { return implementation->cascade(); }
```

References trisycl::detail::shared_ptr_implementation< device< Layout >, detail::device< Layout > >::implementation.

12.20.4.3 connect() [1/2]

```
template<typename Layout >
template<typename SrcPort , typename DstPort >
void trisycl::vendor::xilinx::acap::aie::device< Layout >::connect (
              SrcPort && src,
              DstPort && dst )  [inline]
```

Connect the ports of 2 tiles or shims together with an hyperspace switched circuit, jumping over the underlying routing infrastructure.

This is used to speed up communication in emulation and to skip the need of a routing planner.

Todo To deprecate and implement in another way?

Parameters

in	*T*	is the type of the data to be transferred
in	*SrcPort*	is the type of the source port, such as port::tile or port::shim
in	*DstPort*	is the type of the destination port, such as port::tile or port::shim

Exceptions

trisycl::runtime_error	if some coordinates or port numbers are invalid

Todo Refactor, make the difference between user & physical ports

Definition at line 223 of file device.hpp.

```
00223                                        {
00224     implementation->connect(std::forward<SrcPort>(src),
00225                             std::forward<DstPort>(dst));
00226   }
```

References trisycl::detail::shared_ptr_implementation< device< Layout >, detail::device< Layout > >::implementation, and src.

12.20.4.4 connect() [2/2]

```
template<typename Layout >
template<typename SrcPort , typename DstPort >
void trisycl::vendor::xilinx::acap::aie::device< Layout >::connect (
            SrcPort && src,
            DstPort && dst )  [inline]
```

Connect the ports of 2 tiles or shims together with an hyperspace switched circuit, jumping over the underlying routing infrastructure.

This is used to speed up communication in emulation and to skip the need of a routing planner.

Todo To deprecate and implement in another way?

Parameters

in	*T*	is the type of the data to be transferred
in	*SrcPort*	is the type of the source port, such as port::tile or port::shim
in	*DstPort*	is the type of the destination port, such as port::tile or port::shim

Exceptions

trisycl::runtime_error	if some coordinates or port numbers are invalid

Todo Refactor, make the difference between user & physical ports

Definition at line 223 of file device.hpp.

```
00223                                       {
00224     implementation->connect(std::forward<SrcPort>(src),
00225                             std::forward<DstPort>(dst));
00226   }
```

References trisycl::detail::shared_ptr_implementation< device< Layout >, detail::device< Layout > >::implementation, and src.

12.20.4.5 display() [1/2]

```
template<typename Layout >
auto trisycl::vendor::xilinx::acap::aie::device< Layout >::display (
             const std::string & file_name = {} )  [inline]
```

Display the device layout.

Parameters

in	*file_name*	is the name of the file to write the LaTeX drawing into or use std::cerr by default

Definition at line 239 of file device.hpp.

```
00239                                       {}) {
00240     return implementation->display(file_name);
00241   }
```

12.20.4.6 display() [2/2]

```
template<typename Layout >
auto trisycl::vendor::xilinx::acap::aie::device< Layout >::display (
             const std::string & file_name = {} )  [inline]
```

Display the device layout.

Parameters

in	*file_name*	is the name of the file to write the LaTeX drawing into or use std::cerr by default

Definition at line 239 of file device.hpp.

```
00239                                       {}) {
00240     return implementation->display(file_name);
00241   }
```

12.20.4.7 for_each_tile() [1/2]

```
template<typename Layout >
template<typename F >
```

```
void trisycl::vendor::xilinx::acap::aie::device< Layout >::for_each_tile (
            F && f )  [inline]
```

Apply a function for each tile infrastructure of the device.

Parameters

f	is a callable that is to be called like `f(x,y)` for each tile

Definition at line 92 of file device.hpp.

```
00092                                                {
00093     implementation->for_each_tile(std::forward<F>(f));
00094   };
```

References trisycl::detail::shared_ptr_implementation< device< Layout >, detail::device< Layout > >::implementation.

12.20.4.8 for_each_tile() [2/2]

```
template<typename Layout >
template<typename F >
void trisycl::vendor::xilinx::acap::aie::device< Layout >::for_each_tile (
            F && f )  [inline]
```

Apply a function for each tile infrastructure of the device.

Parameters

f	is a callable that is to be called like `f(x,y)` for each tile

Definition at line 92 of file device.hpp.

```
00092                                                {
00093     implementation->for_each_tile(std::forward<F>(f));
00094   };
```

References trisycl::detail::shared_ptr_implementation< device< Layout >, detail::device< Layout > >::implementation.

12.20.4.9 for_each_tile_index() [1/2]

```
template<typename Layout >
template<typename F >
void trisycl::vendor::xilinx::acap::aie::device< Layout >::for_each_tile_index (
            F && f )  [inline]
```

Apply a function for each tile index of the device.

Parameters

f	is a callable that is to be called like `f(x,y)` for each tile

Definition at line 83 of file device.hpp.

```
00083                                                 {
00084     implementation->for_each_tile_index(std::forward<F>(f));
00085   };
```

References trisycl::detail::shared_ptr_implementation< device< Layout >, detail::device< Layout > >::implementation.

12.20.4.10 for_each_tile_index() [2/2]

```
template<typename Layout >
template<typename F >
void trisycl::vendor::xilinx::acap::aie::device< Layout >::for_each_tile_index (
             F && f )  [inline]
```

Apply a function for each tile index of the device.

Parameters

f	is a callable that is to be called like `f(x,y)` for each tile

Definition at line 83 of file device.hpp.

```
00083                                                 {
00084     implementation->for_each_tile_index(std::forward<F>(f));
00085   };
```

References trisycl::detail::shared_ptr_implementation< device< Layout >, detail::device< Layout > >::implementation.

12.20.4.11 for_each_tile_neighborhood() [1/2]

```
template<typename Layout >
template<typename F >
void trisycl::vendor::xilinx::acap::aie::device< Layout >::for_each_tile_neighborhood (
             F && f )  [inline]
```

Apply a invocable on all the AXI stream of the neighborhood of each tile.

Definition at line 230 of file device.hpp.

```
00230                                                           {
00231     implementation->for_each_tile_neighborhood(std::forward<F>(f));
00232   }
```

References trisycl::detail::shared_ptr_implementation< device< Layout >, detail::device< Layout > >::implementation.

12.20.4.12 for_each_tile_neighborhood() [2/2]

```
template<typename Layout >
template<typename F >
void trisycl::vendor::xilinx::acap::aie::device< Layout >::for_each_tile_neighborhood (
            F && f )  [inline]
```

Apply a invocable on all the AXI stream of the neighborhood of each tile.

Definition at line 230 of file device.hpp.

```
00230                                                          {
00231     implementation->for_each_tile_neighborhood(std::forward<F>(f));
00232   }
```

References trisycl::detail::shared_ptr_implementation< device< Layout >, detail::device< Layout > >::implementation.

12.20.4.13 for_each_tile_x_index() [1/2]

```
template<typename Layout >
template<typename F >
void trisycl::vendor::xilinx::acap::aie::device< Layout >::for_each_tile_x_index (
            F && f )  [inline]
```

Apply a function for each x tile index of the device.

Parameters

f	is a callable that is to be called like `f(x)` for each horizontal index value

Definition at line 101 of file device.hpp.

```
00101                                                  {
00102     implementation->for_each_tile_x_index(std::forward<F>(f));
00103   };
```

References trisycl::detail::shared_ptr_implementation< device< Layout >, detail::device< Layout > >::implementation.

12.20.4.14 for_each_tile_x_index() [2/2]

```
template<typename Layout >
template<typename F >
void trisycl::vendor::xilinx::acap::aie::device< Layout >::for_each_tile_x_index (
            F && f )  [inline]
```

Apply a function for each x tile index of the device.

Parameters

f	is a callable that is to be called like `f(x)` for each horizontal index value

Definition at line 101 of file device.hpp.

```
00101                                                    {
00102     implementation->for_each_tile_x_index(std::forward<F>(f));
00103   };
```

References trisycl::detail::shared_ptr_implementation< device< Layout >, detail::device< Layout > >::implementation.

12.20.4.15 for_each_tile_y_index() [1/2]

```
template<typename Layout >
template<typename F >
void trisycl::vendor::xilinx::acap::aie::device< Layout >::for_each_tile_y_index (
            F && f )  [inline]
```

Apply a function for each y tile index of the device.

Parameters

f	is a callable that is to be called like `f(x)` for each vertical index value

Definition at line 110 of file device.hpp.

```
00110                                                    {
00111     implementation->for_each_tile_y_index(std::forward<F>(f));
00112   };
```

References trisycl::detail::shared_ptr_implementation< device< Layout >, detail::device< Layout > >::implementation.

12.20.4.16 for_each_tile_y_index() [2/2]

```
template<typename Layout >
template<typename F >
void trisycl::vendor::xilinx::acap::aie::device< Layout >::for_each_tile_y_index (
            F && f )  [inline]
```

Apply a function for each y tile index of the device.

Parameters

f	is a callable that is to be called like `f(x)` for each vertical index value

Definition at line 110 of file device.hpp.

```
00110                                                    {
00111     implementation->for_each_tile_y_index(std::forward<F>(f));
00112   };
```

References trisycl::detail::shared_ptr_implementation< device< Layout >, detail::device< Layout > >::implementation.

12.20.4.17 mem() [1/2]

```
template<typename Layout >
auto & trisycl::vendor::xilinx::acap::aie::device< Layout >::mem (
            int x,
            int y )  [inline]
```

Access to the common infrastructure part of a tile memory.

Parameters

in	*x*	is the horizontal tile coordinate
in	*y*	is the vertical tile coordinate

Exceptions

trisycl::runtime_error	if the coordinate is invalid

Definition at line 132 of file device.hpp.

```
00132 { return implementation->mem(x, y); }
```

References trisycl::detail::shared_ptr_implementation< device< Layout >, detail::device< Layout > >::implementation, x, and trisycl::y.

12.20.4.18 mem() [2/2]

```
template<typename Layout >
auto & trisycl::vendor::xilinx::acap::aie::device< Layout >::mem (
            int x,
            int y )  [inline]
```

Access to the common infrastructure part of a tile memory.

Parameters

in	*x*	is the horizontal tile coordinate
in	*y*	is the vertical tile coordinate

Exceptions

trisycl::runtime_error	if the coordinate is invalid

Definition at line 132 of file device.hpp.

```
00132 { return implementation->mem(x, y); }
```

References trisycl::detail::shared_ptr_implementation< device< Layout >, detail::device< Layout > >::implementation, x, and trisycl::y.

12.20.4.19 program() [1/2]

```
template<typename Layout >
template<template< typename Device, int X, int Y > typename Tile = acap::aie::tile, template<
typename Device, int X, int Y > typename Memory = acap::aie::memory>
auto trisycl::vendor::xilinx::acap::aie::device< Layout >::program ( )  [inline]
```

Create a program execution for this device.

Parameters

Tile	is the description of the program tiles to instantiate. By default each tile will run an empty program.
Memory	is the description of the machine memory modules. By default the machine has empty memory modules.

Definition at line 161 of file device.hpp.

```
00161                 {
00162     return aie::program<device, Tile, Memory> { *this };
00163   }
```

12.20.4.20 program() [2/2]

```
template<typename Layout >
template<template< typename Device, int X, int Y > typename Tile = acap::aie::tile, template<
typename Device, int X, int Y > typename Memory = acap::aie::memory>
auto trisycl::vendor::xilinx::acap::aie::device< Layout >::program ( )  [inline]
```

Create a program execution for this device.

Parameters

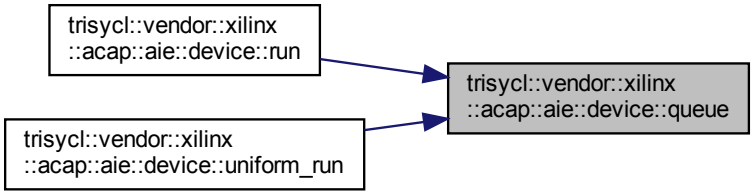
Tile	is the description of the program tiles to instantiate. By default each tile will run an empty program.
Memory	is the description of the machine memory modules. By default the machine has empty memory modules.

Definition at line 161 of file device.hpp.

```
00161                 {
00162     return aie::program<device, Tile, Memory> { *this };
00163   }
```

12.20.4.21 queue() [1/2]

```
template<typename Layout >
auto trisycl::vendor::xilinx::acap::aie::device< Layout >::queue ( )  [inline]
```



Create a queue on this device.

Definition at line 147 of file device.hpp.

```
00147 { return vendor::xilinx::acap::aie::queue { *this }; }
```

Referenced by trisycl::vendor::xilinx::acap::aie::device< Layout >::run(), and trisycl::vendor::xilinx::acap::aie::device< Layout >::unifo

Here is the caller graph for this function:

12.20.4.22 queue() [2/2]

```
template<typename Layout >
auto trisycl::vendor::xilinx::acap::aie::device< Layout >::queue ( )  [inline]
```

Create a queue on this device.

Definition at line 147 of file device.hpp.

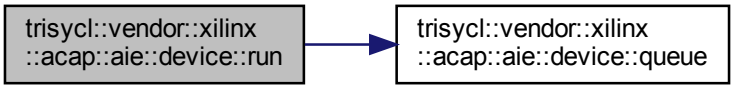
```
00147 { return vendor::xilinx::acap::aie::queue { *this }; }
```

12.20.4.23 run() [1/4]

```
template<typename Layout >
template<template< typename Device, int X, int Y > typename Tile = acap::aie::tile, template<
typename Device, int X, int Y > typename Memory = acap::aie::memory>
void trisycl::vendor::xilinx::acap::aie::device< Layout >::run ( )  [inline]
```

Shortcut to run synchronously a program on this queue.

Parameters



Tile	is the description of the program tiles to instantiate. By default each tile will run an empty program.
Memory	is the description of the machine memory modules. By default the machine has empty memory modules.

Definition at line 177 of file device.hpp.

```
00177             {
00178     queue().template run<Tile, Memory>();
00179   }
```

References trisycl::vendor::xilinx::acap::aie::device< Layout >::queue().

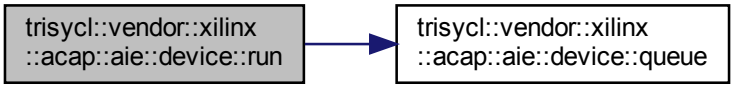
Here is the call graph for this function:

12.20.4.24 run() [2/4]

```
template<typename Layout >
template<template< typename Device, int X, int Y > typename Tile = acap::aie::tile, template<
typename Device, int X, int Y > typename Memory = acap::aie::memory>
void trisycl::vendor::xilinx::acap::aie::device< Layout >::run ( )  [inline]
```

Shortcut to run synchronously a program on this queue.

Parameters



Tile	is the description of the program tiles to instantiate. By default each tile will run an empty program.
Memory	is the description of the machine memory modules. By default the machine has empty memory modules.

Definition at line 177 of file device.hpp.

```
00177             {
00178     queue().template run<Tile, Memory>();
00179   }
```

References trisycl::vendor::xilinx::acap::aie::device< Layout >::queue().

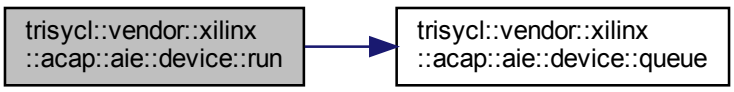
Here is the call graph for this function:

12.20.4.25 run() [3/4]

```
template<typename Layout >
template<typename Invocable >
void trisycl::vendor::xilinx::acap::aie::device< Layout >::run (
             Invocable && f )  [inline]
```

Shortcut to run synchronously an heterogeneous invocable on this queue.

Parameters



f	is an invocable taking an heterogeneous tile handler

Definition at line 186 of file device.hpp.

```
00186                                                    {
00187     queue().run(std::forward<Invocable>(f));
00188   }
```

References trisycl::vendor::xilinx::acap::aie::device< Layout >::queue().

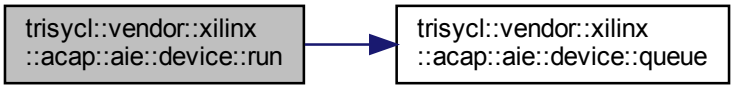
Here is the call graph for this function:

12.20.4.26 run() [4/4]

```
template<typename Layout >
template<typename Invocable >
void trisycl::vendor::xilinx::acap::aie::device< Layout >::run (
             Invocable && f )  [inline]
```

Shortcut to run synchronously an heterogeneous invocable on this queue.

Parameters



f	is an invocable taking an heterogeneous tile handler

Definition at line 186 of file device.hpp.

```
00186                                                    {
00187     queue().run(std::forward<Invocable>(f));
00188   }
```

References trisycl::vendor::xilinx::acap::aie::device< Layout >::queue().

Here is the call graph for this function:

12.20.4.27 shim() [1/2]

```
template<typename Layout >
auto & trisycl::vendor::xilinx::acap::aie::device< Layout >::shim (
            int x )  [inline]
```

Access to the shim tile.

Parameters

in	*x*	is the horizontal coordinate of the shim tile

Exceptions

trisycl::runtime_error	if the coordinate is invalid

Definition at line 140 of file device.hpp.

```
00140 { return implementation->shim(x); }
```

References trisycl::detail::shared_ptr_implementation< device< Layout >, detail::device< Layout > >::implementation, and x.

12.20.4.28 shim() [2/2]

```
template<typename Layout >
auto & trisycl::vendor::xilinx::acap::aie::device< Layout >::shim (
            int x )  [inline]
```

Access to the shim tile.

Parameters

in	*x*	is the horizontal coordinate of the shim tile

Exceptions

trisycl::runtime_error	if the coordinate is invalid

Definition at line 140 of file device.hpp.

```
00140 { return implementation->shim(x); }
```

References trisycl::detail::shared_ptr_implementation< device< Layout >, detail::device< Layout > >::implementation, and x.

12.20.4.29 tile() [1/2]

```
template<typename Layout >
auto & trisycl::vendor::xilinx::acap::aie::device< Layout >::tile (
            int x,
            int y )  [inline]
```

Access to the common infrastructure part of a tile.

Parameters

in	*x*	is the horizontal tile coordinate
in	*y*	is the vertical tile coordinate

Exceptions

trisycl::runtime_error	if the coordinate is invalid

Definition at line 122 of file device.hpp.

```
00122 { return implementation->tile(x, y); }
```

References trisycl::detail::shared_ptr_implementation< device< Layout >, detail::device< Layout > >::implementation, x, and trisycl::y.

12.20.4.30 tile() [2/2]

```
template<typename Layout >
auto & trisycl::vendor::xilinx::acap::aie::device< Layout >::tile (
            int x,
            int y )  [inline]
```

Access to the common infrastructure part of a tile.

Parameters

in	*x*	is the horizontal tile coordinate
in	*y*	is the vertical tile coordinate

Exceptions

trisycl::runtime_error	if the coordinate is invalid

Definition at line 122 of file device.hpp.

```
00122 { return implementation->tile(x, y); }
```

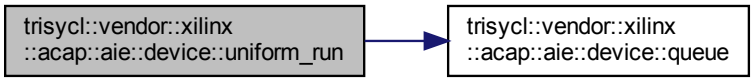
References trisycl::detail::shared_ptr_implementation< device< Layout >, detail::device< Layout > >::implementation, x, and trisycl::y.

12.20.4.31 uniform_run() [1/2]

```
template<typename Layout >
template<typename Invocable >
void trisycl::vendor::xilinx::acap::aie::device< Layout >::uniform_run (
            Invocable && f )  [inline]
```

Shortcut to run synchronously a uniform invocable on this queue.

Parameters



f	is an invocable taking a uniform tile handler

Definition at line 195 of file device.hpp.

```
00195                                                                    {
00196     queue().uniform_run(std::forward<Invocable>(f));
00197     queue().wait();
00198   }
```

References trisycl::vendor::xilinx::acap::aie::device< Layout >::queue().

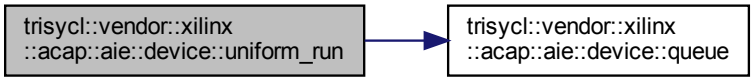
Here is the call graph for this function:

12.20.4.32 uniform_run() [2/2]

```
template<typename Layout >
template<typename Invocable >
void trisycl::vendor::xilinx::acap::aie::device< Layout >::uniform_run (
            Invocable && f )  [inline]
```

Shortcut to run synchronously a uniform invocable on this queue.

Parameters



f	is an invocable taking a uniform tile handler

Definition at line 195 of file device.hpp.

```
00195                                                                    {
00196     queue().uniform_run(std::forward<Invocable>(f));
00197     queue().wait();
00198   }
```

References trisycl::vendor::xilinx::acap::aie::device< Layout >::queue().

Here is the call graph for this function:

12.20.5 Member Data Documentation

12.20.5.1 size

```
template<typename Layout >
auto constexpr trisycl::vendor::xilinx::acap::aie::device< Layout >::size = geo::size  [static],
[constexpr]
```

Total number of tiles in the CGRA.

Definition at line 72 of file device.hpp.

12.20.5.2 x_max

```
template<typename Layout >
auto constexpr trisycl::vendor::xilinx::acap::aie::device< Layout >::x_max = geo::x_max  [static],
[constexpr]
```

Maximum horizontal coordinate.

Definition at line 57 of file device.hpp.

12.20.5.3 x_min

```
template<typename Layout >
auto constexpr trisycl::vendor::xilinx::acap::aie::device< Layout >::x_min = geo::x_min  [static],
[constexpr]
```

Minimum horizontal coordinate.

Definition at line 54 of file device.hpp.

12.20.5.4 x_size

```
template<typename Layout >
auto constexpr trisycl::vendor::xilinx::acap::aie::device< Layout >::x_size = geo::x_size
[static], [constexpr]
```

Number of tile horizontally in the CGRA.

Definition at line 60 of file device.hpp.

12.20.5.5 y_max

```
template<typename Layout >
auto constexpr trisycl::vendor::xilinx::acap::aie::device< Layout >::y_max = geo::y_max  [static],
[constexpr]
```

Maximum vertical coordinate.

Definition at line 66 of file device.hpp.

12.20.5.6 y_min

```
template<typename Layout >
auto constexpr trisycl::vendor::xilinx::acap::aie::device< Layout >::y_min = geo::y_min  [static],
[constexpr]
```

Minimum vertical coordinate.

Definition at line 63 of file device.hpp.

12.20.5.7 y_size

```
template<typename Layout >
auto constexpr trisycl::vendor::xilinx::acap::aie::device< Layout >::y_size = geo::y_size
[static], [constexpr]
```

Number of tile vertically in the CGRA.

Definition at line 69 of file device.hpp.

Collaboration diagram for trisycl::vendor::xilinx::acap::aie::dma< AXIStreamSwitch, SpecializedDMA >:

Public Member Functions

- dma (::trisycl::detail::fiber_pool &fe)

  Start the DMA engine using an executor.
- ~dma ()

  Destructor handling the correct infrastructure shutdown.
- SpecializedDMA & wait ()

  Wait for the transfers to complete.
- dma (::trisycl::detail::fiber_pool &fe)

  Start the DMA engine using an executor.
- ~dma ()

  Destructor handling the correct infrastructure shutdown.
- SpecializedDMA & wait ()

  Wait for the transfers to complete.

Protected Member Functions

- template<typename Cmd >
  void push_command (Cmd &&command)

  Enqueue a DMA command.
- template<typename Cmd >
  void push_command (Cmd &&command)

  Enqueue a DMA command.

Private Types

- using dma_command = std::function< void(void)>

  Use std::span for 1D contiguous transfers only for now.
- using dma_command = std::function< void(void)>

  Use std::span for 1D contiguous transfers only for now.

Private Member Functions

- void join ()

  Wait for the fiber to complete.
- template<typename Invocable >
  void launch (::trisycl::detail::fiber_pool &fiber_executor, Invocable &&f)

  Launch the data mover on the execution pool.
- auto pop_command (auto &command)

  Dequeue a DMA command.
- void commit_command ()

  Notify a command has been processed.
- void join ()

  Wait for the fiber to complete.
- template<typename Invocable >
  void launch (::trisycl::detail::fiber_pool &fiber_executor, Invocable &&f)

  Launch the data mover on the execution pool.
- auto pop_command (auto &command)

  Dequeue a DMA command.
- void commit_command ()

  Notify a command has been processed.

Private Attributes

- boost::fibers::buffered_channel< dma_command > c { 8 }

  Queue for generic DMA commands.
- ::trisycl::detail::fiber_pool::future< void > data_mover

  To shepherd the fiber playing the data mover behind the DMA.
- std::atomic< int > nb_command { 0 }

  Count the in-flight commands.
- boost::fibers::condition_variable waiting_room

  To wait for the DMA command queue to drain.
- boost::fibers::mutex waiting_mutex

  To protect the waiting mechanism.

Additional Inherited Members

12.21.1 Detailed Description

template<typename AXIStreamSwitch, typename SpecializedDMA>
class trisycl::vendor::xilinx::acap::aie::dma< AXIStreamSwitch, SpecializedDMA >

Generic DMA.

Definition at line 103 of file dma.hpp.

12.21.2 Member Typedef Documentation

12.21.2.1 dma_command [1/2]

```
template<typename AXIStreamSwitch , typename SpecializedDMA >
using trisycl::vendor::xilinx::acap::aie::dma< AXIStreamSwitch, SpecializedDMA >::dma_command
= std::function<void(void)>  [private]
```

Use std::span for 1D contiguous transfers only for now.

The type of commands executable by the DMA. Very generic for now

Definition at line 110 of file dma.hpp.

12.21.2.2 dma_command [2/2]

```
template<typename AXIStreamSwitch , typename SpecializedDMA >
using trisycl::vendor::xilinx::acap::aie::dma< AXIStreamSwitch, SpecializedDMA >::dma_command
= std::function<void(void)>  [private]
```

Use std::span for 1D contiguous transfers only for now.

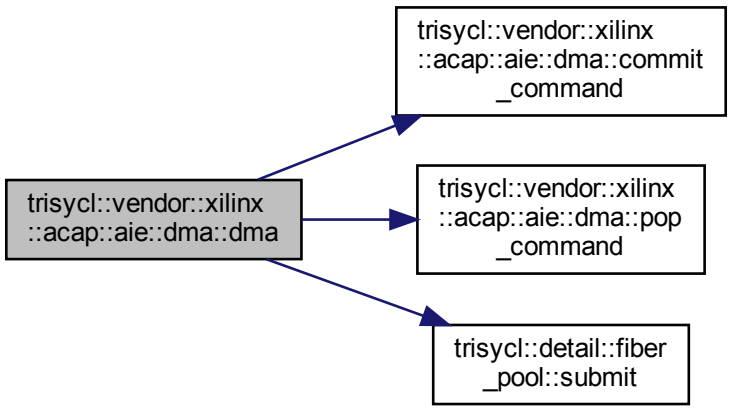
The type of commands executable by the DMA. Very generic for now

Definition at line 110 of file dma.hpp.

12.21.3 Constructor & Destructor Documentation

12.21.3.1 dma() [1/2]

```
template<typename AXIStreamSwitch , typename SpecializedDMA >
trisycl::vendor::xilinx::acap::aie::dma< AXIStreamSwitch, SpecializedDMA >::dma (
            ::trisycl::detail::fiber_pool & fe )  [inline]
```



Start the DMA engine using an executor.

Definition at line 156 of file dma.hpp.

```
00156                                       {
00157     data_mover = fe.submit([&] {
00158       dma_command sp;
00159       for (;;) {
00160         // Read a DMA command
00161         if (this->pop_command(sp) != boost::fibers::channel_op_status::success)
00162           // The channel is closed, stop working
00163           break;
00164         // Execute the command
00165         sp();
00166         commit_command();
00167       }
00168     });
00169   }
```

References trisycl::vendor::xilinx::acap::aie::dma< AXIStreamSwitch, SpecializedDMA >::commit_command(), trisycl::vendor::xilinx::acap::aie::dma< AXIStreamSwitch, SpecializedDMA >::data_mover, trisycl::vendor::xilinx::acap::aie::dma< AX and trisycl::detail::fiber_pool::submit().

12.23.1 Detailed Description

Definition at line 14 of file event.hpp.

12.23.2 Constructor & Destructor Documentation

12.23.2.1 ~event()

```
virtual trisycl::detail::event::~event ( )  [inline], [virtual]
```

Definition at line 35 of file event.hpp.

```
00035 {}
```

12.23.3 Member Function Documentation

12.23.3.1 get()

```
virtual cl_event trisycl::detail::event::get ( ) const  [pure virtual]
```

Return the cl_event of the underlying OpenCL event.

Implemented in trisycl::detail::host_event, and trisycl::detail::opencl_event.

12.23.3.2 get_boost_compute()

```
virtual const boost::compute::event & trisycl::detail::event::get_boost_compute ( ) const
[pure virtual]
```

Return the underlying Boost.Compute event, if any.

Implemented in trisycl::detail::host_event, and trisycl::detail::opencl_event.

12.23.3.3 get_command_execution_status()

```
virtual info::event_command_status trisycl::detail::event::get_command_execution_status ( )
const  [pure virtual]
```

Implemented in trisycl::detail::host_event, and trisycl::detail::opencl_event.

12.23.3.4 get_profiling_info()

```
virtual cl_ulong trisycl::detail::event::get_profiling_info (
            info::event_profiling param ) const  [pure virtual]
```

Implemented in trisycl::detail::host_event, and trisycl::detail::opencl_event.

12.23.3.5 get_reference_count()

```
virtual cl_uint trisycl::detail::event::get_reference_count ( ) const  [pure virtual]
```

Implemented in trisycl::detail::host_event, and trisycl::detail::opencl_event.

12.23.3.6 is_host()

```
virtual bool trisycl::detail::event::is_host ( ) const  [pure virtual]
```

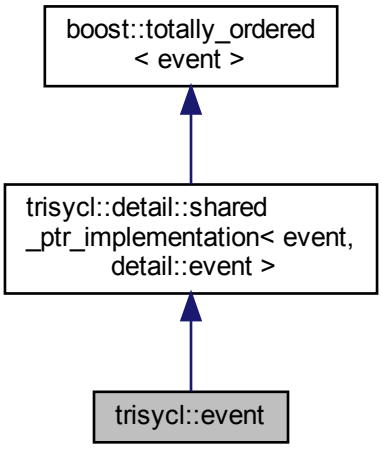
Implemented in trisycl::detail::host_event, and trisycl::detail::opencl_event.

12.23.3.7 wait()

```
virtual void trisycl::detail::event::wait ( ) const  [pure virtual]
```

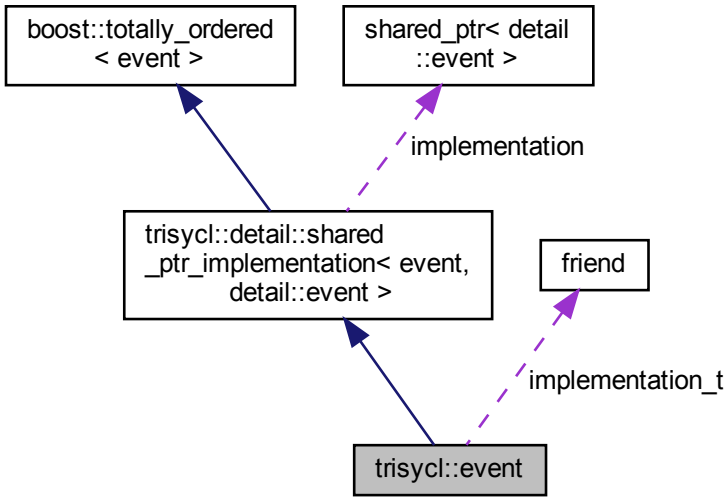
Implemented in trisycl::detail::host_event, and trisycl::detail::opencl_event.

The documentation for this struct was generated from the following file:



- include/triSYCL/event/detail/event.hpp

12.24 trisycl::event Class Reference



SYCL event.

```
#include <event.hpp>
```

Inheritance diagram for trisycl::event:

Collaboration diagram for trisycl::event:

Public Member Functions

- event ()
- event (cl_event clEvent, const context &syclContext)

  Construct an event class using the clEvent from OpenCL.
- event (const boost::compute::event &e)

  Construct an event class using the boost::compute::event.
- bool is_host () const

  Return true if the event is a SYCL host event.
- cl_event get ()

  Return the cl_event from the underlying OpenCL event.
- boost::compute::event get_boost_compute () const

  Return the underlying boost compute event.
- vector_class< event > get_wait_list ()
- void wait ()

  Wait for the event and the command associated with it to complete.
- void wait_and_throw ()
- template<info::event param>
  auto get_info () const

  Query the event for information.
- template<info::event_profiling param>
  auto get_profiling_info () const

  Query the event for event profiling.

12.25 trisycl::detail::fiber_pool Class Reference

```
#include <fiber_pool.hpp>
```

Collaboration diagram for trisycl::detail::fiber_pool:

Public Types

- enum class sched { round_robin , shared_work , work_stealing }

  To select some various Boost.Fibers schedulers.
- template<typename T >
  using future = boost::fibers::future< T >

  The type of the future used by the implementation underneath.

Public Member Functions

- fiber_pool (int thread_number, sched scheduler, bool suspend)

  Create a fiber_pool.
- template<typename Callable >
  auto submit (Callable &&work)

  Submit some work on a new fiber.
- void close ()

  Close the submission.
- void join ()

  Wait for all the threads are done.
- ~fiber_pool ()

  Wait for some remaining work to be done.

Private Member Functions

- void run (int i)

  The thread worker job.

Private Attributes

- std::vector< std::future< void > > working_threads

  The thread running the Boost.Fiber schedulers to do the work.
- boost::fibers::unbuffered_channel< std::function< void(void)> > submission

  The queue to submit work.
- boost::barrier starting_block

  To synchronize all the threads before they can run some fibers.
- boost::fibers::barrier finish_line

  To synchronize all the threads after their last fiber.
- bool joinable = true

  To avoid joining several times.
- sched s

  The model of scheduler.
- pooled_work_stealing::ctx pc_stealing
- pooled_shared_work::ctx pc_shared

Static Private Attributes

- static auto constexpr starting_mode = boost::fibers::launch::dispatch

  Non-blocking read from the FIFO channel.

Private Types

- using value_type = axi_packet::value_type

  Payload data type.
- using value_type = axi_packet::value_type

  Payload data type.

Private Attributes

- boost::fibers::buffered_channel< axi_packet > c { capacity }

  The underlying FIFO.

Static Private Attributes

- static auto constexpr capacity = 16

  FIFO capacity queue.

12.26.1 Detailed Description

A FIFO channel connection.

Todo factorize out router minion

Todo factorize out router minion

Definition at line 115 of file connection.hpp.

12.26.2 Member Typedef Documentation

12.26.2.1 value_type [1/2]

```
using trisycl::vendor::xilinx::acap::aie::fifo_channel::value_type = axi_packet::value_type
[private]
```

Payload data type.

Definition at line 121 of file connection.hpp.

12.26.2.2 value_type [2/2]

```
using trisycl::vendor::xilinx::acap::aie::fifo_channel::value_type = axi_packet::value_type
[private]
```

Payload data type.

Definition at line 121 of file connection.hpp.

12.26.3 Member Function Documentation

12.26.3.1 read() [1/2]

```
value_type trisycl::vendor::xilinx::acap::aie::fifo_channel::read ( )  [inline], [override],
[virtual]
```

Waiting read from the FIFO channel.

Implements trisycl::vendor::xilinx::acap::aie::communicator_port.

Definition at line 144 of file connection.hpp.

```
00144                                {
00145     return c.value_pop().data;
00146   }
```

References c.

12.26.3.2 read() [2/2]

```
value_type trisycl::vendor::xilinx::acap::aie::fifo_channel::read ( )  [inline], [override],
[virtual]
```

Waiting read from the FIFO channel.

Implements trisycl::vendor::xilinx::acap::aie::communicator_port.

Definition at line 144 of file connection.hpp.

```
00144                                {
00145     return c.value_pop().data;
00146   }
```

References c.

12.26.3.3 try_read() [1/2]

```
bool trisycl::vendor::xilinx::acap::aie::fifo_channel::try_read (
            value_type & v )  [inline], [override], [virtual]
```

Non-blocking read from the FIFO channel.

Returns

true if the value was correctly read

Implements trisycl::vendor::xilinx::acap::aie::communicator_port.

Definition at line 153 of file connection.hpp.

```
00153                                       {
00154     axi_packet p;
00155     if (c.try_pop(p) == boost::fibers::channel_op_status::success) {
00156       v = p.data;
00157       return true;
00158     }
00159     return false;
00160   }
```

References c, and p.

12.26.3.4 try_read() [2/2]

```
bool trisycl::vendor::xilinx::acap::aie::fifo_channel::try_read (
            value_type & v )  [inline], [override], [virtual]
```

Non-blocking read from the FIFO channel.

Returns

true if the value was correctly read

Implements trisycl::vendor::xilinx::acap::aie::communicator_port.

Definition at line 153 of file connection.hpp.

```
00153                                       {
00154     axi_packet p;
00155     if (c.try_pop(p) == boost::fibers::channel_op_status::success) {
00156       v = p.data;
00157       return true;
00158     }
00159     return false;
00160   }
```

References c, and p.

12.26.3.5 try_write() [1/2]

```
bool trisycl::vendor::xilinx::acap::aie::fifo_channel::try_write (
            const axi_packet & v )  [inline], [override], [virtual]
```

Try to enqueue a packet to the FIFO channel.

Returns

true if the packet is correctly enqueued

Implements trisycl::vendor::xilinx::acap::aie::communicator_port.

Definition at line 138 of file connection.hpp.

```
00138                                                {
00139     return c.try_push(v) == boost::fibers::channel_op_status::success;
00140   }
```

References c.

12.26.3.6 try_write() [2/2]

```
bool trisycl::vendor::xilinx::acap::aie::fifo_channel::try_write (
            const axi_packet & v )  [inline], [override], [virtual]
```

Try to enqueue a packet to the FIFO channel.

Returns

true if the packet is correctly enqueued

Implements trisycl::vendor::xilinx::acap::aie::communicator_port.

Definition at line 138 of file connection.hpp.

```
00138                                                {
00139     return c.try_push(v) == boost::fibers::channel_op_status::success;
00140   }
```

References c.

12.26.3.7 write() [1/2]

```
void trisycl::vendor::xilinx::acap::aie::fifo_channel::write (
            const axi_packet & v )  [inline], [override], [virtual]
```

Enqueue a packet to the FIFO channel.

Implements trisycl::vendor::xilinx::acap::aie::communicator_port.

Definition at line 129 of file connection.hpp.

```
00129                                               {

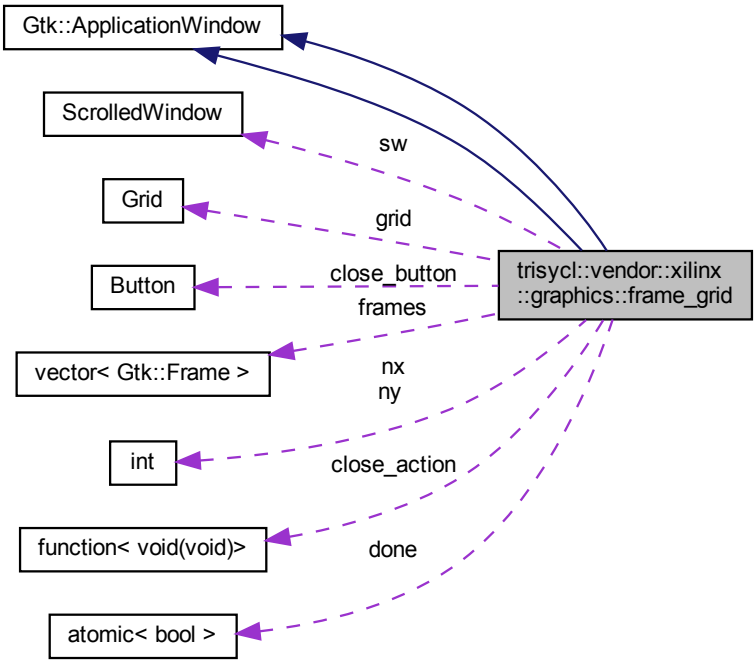
12.27 trisycl::vendor::xilinx::graphics::frame_grid Struct Reference



An application window displaying a grid of tiles.

`#include <graphics.hpp>`

Inheritance diagram for trisycl::vendor::xilinx::graphics::frame_grid:

Collaboration diagram for trisycl::vendor::xilinx::graphics::frame_grid:

Public Member Functions

- frame_grid (int nx, int ny)
  Create a grid of tiles.
- void set_close_action (std::function< void(void)> f)
  Set a function to be called on close.
- auto & get_frame (int x, int y)
  Get the frame at a given grid position.
- frame_grid (int nx, int ny)
  Create a grid of tiles.
- void set_close_action (std::function< void(void)> f)
  Set a function to be called on close.
- auto & get_frame (int x, int y)
  Get the frame at a given grid position.

Public Attributes

- Gtk::ScrolledWindow sw
  Nice to have some scroll bars around when the main window is too small.
- Gtk::Grid grid
  The container to represent the grid of tile images.
- Gtk::Button close_button { "Close" }
  A close button in case the closing function is not provided by the window manager.
- std::vector< Gtk::Frame > frames
  The linearized 2D vector of frames used to decorate the tile images with some frames with the tile names.
- int nx
  Number of frame columns.
- int ny
  Number of frame lines.
- std::function< void(void)> close_action
  An action to do when the window is closed.
- std::atomic< bool > done = false
  Set to true by the closing handler.

12.27.1 Detailed Description

An application window displaying a grid of tiles.

Each tile is framed with the tile identifiers

Definition at line 56 of file graphics.hpp.

12.27.2 Constructor & Destructor Documentation

12.27.2.1 frame_grid() [1/2]

```
trisycl::vendor::xilinx::graphics::frame_grid::frame_grid (
            int nx,
            int ny )  [inline]
```

Create a grid of tiles.

Parameters

in	*nx*	is the numer of tiles horizontally
in	*ny*	is the numer of tiles vertically

Definition at line 90 of file graphics.hpp.

```
00090                                 :  nx { nx }, ny { ny } {
00091     set_default_size(1900, 1020);
00092
00093     add(sw);
00094     sw.add(grid);
00095     for (int y = 0; y < ny; ++y)
00096       for (int x = 0; x < nx; ++x) {
00097         std::ostringstream s;
00098         s « "Tile(" « x « ',' « y « ')';
00099         frames.emplace_back(s.str());
00100         frames.back().set_shadow_type(Gtk::SHADOW_ETCHED_OUT);
00101         // A minimal border to save space on main window
00102         frames.back().set_border_width(1);
00103         // Display the frame with the lower y South in a mathematical sense
00104         grid.attach(frames.back(), x, ny - y - 1, 1, 1);
00105       }
00106
00107     grid.add(close_button);
00108
00109     // Make the button the default widget
00110     close_button.set_can_default();
00111     close_button.grab_default();
00112
00113     // Connect the clicked signal of the close button to
00114     close_button.signal_clicked().connect([this] {
00115         // Unmap the window from the screen
00116         hide();
00117         // Call the handler if it does exist
00118         if (close_action)
00119           close_action();
00120       });
00121
00122     // Show all children of the window
00123     show_all_children();
00124   }
```

References close_action, close_button, frames, grid, nx, ny, sw, x, and trisycl::y.

12.27.2.2 frame_grid() [2/2]

```
trisycl::vendor::xilinx::graphics::frame_grid::frame_grid (
            int nx,
            int ny )  [inline]
```

Create a grid of tiles.

Parameters

in	*nx*	is the numer of tiles horizontally
in	*ny*	is the numer of tiles vertically

Definition at line 90 of file graphics.hpp.

```
00090                                 :  nx { nx }, ny { ny } {
00091     set_default_size(1900, 1020);
00092
00093     add(sw);
00094     sw.add(grid);
00095     for (int y = 0; y < ny; ++y)
00096       for (int x = 0; x < nx; ++x) {
```

```
00097         std::ostringstream s;
00098         s « "Tile(" « x « ',' « y « ')';
00099         frames.emplace_back(s.str());
00100         frames.back().set_shadow_type(Gtk::SHADOW_ETCHED_OUT);
00101         // A minimal border to save space on main window
00102         frames.back().set_border_width(1);
00103         // Display the frame with the lower y South in a mathematical sense
00104         grid.attach(frames.back(), x, ny - y - 1, 1, 1);
00105       }
00106
00107     grid.add(close_button);
00108
00109     // Make the button the default widget
00110     close_button.set_can_default();
00111     close_button.grab_default();
00112
00113     // Connect the clicked signal of the close button to
00114     close_button.signal_clicked().connect([this] {
00115         // Unmap the window from the screen
00116         hide();
00117         // Call the handler if it does exist
00118         if (close_action)
00119           close_action();
00120       });
00121
00122     // Show all children of the window
00123     show_all_children();
00124   }
```

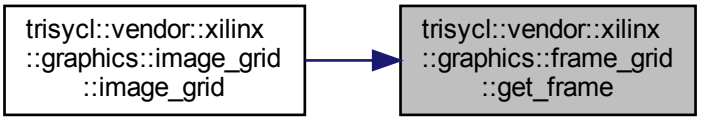
References close_action, close_button, frames, grid, nx, ny, sw, x, and trisycl::y.

12.27.3 Member Function Documentation

12.27.3.1 get_frame() [1/2]

```
auto & trisycl::vendor::xilinx::graphics::frame_grid::get_frame (
            int x,
            int y )  [inline]
```

Get the frame at a given grid position.



Definition at line 134 of file graphics.hpp.

```
00134                                        {
00135     return frames.at(x + nx*y);
00136   }
```

References frames, nx, x, and trisycl::y.

Referenced by trisycl::vendor::xilinx::graphics::image_grid::image_grid().

Here is the caller graph for this function:

12.27.3.2 get_frame() [2/2]

```
auto & trisycl::vendor::xilinx::graphics::frame_grid::get_frame (
            int x,
            int y )  [inline]
```

Get the frame at a given grid position.

Definition at line 134 of file graphics.hpp.

```
00134                                       {
00135     return frames.at(x + nx*y);
00136   }
```

References frames, nx, x, and trisycl::y.

12.27.3.3 set_close_action() [1/2]

```
void trisycl::vendor::xilinx::graphics::frame_grid::set_close_action (
            std::function< void(void)> f )  [inline]
```

Set a function to be called on close.

Definition at line 128 of file graphics.hpp.

```
00128                                                 {
00129     close_action = f;
00130   }
```

References close_action.

12.27.3.4 set_close_action() [2/2]

```
void trisycl::vendor::xilinx::graphics::frame_grid::set_close_action (
            std::function< void(void)> f )  [inline]
```

Set a function to be called on close.

Definition at line 128 of file graphics.hpp.

```
00128                                                 {
00129     close_action = f;
00130   }
```

References close_action.

12.27.4 Member Data Documentation

12.27.4.1 close_action

```
std::function< void(void)> trisycl::vendor::xilinx::graphics::frame_grid::close_action
```

An action to do when the window is closed.

Definition at line 78 of file graphics.hpp.

Referenced by frame_grid(), and set_close_action().

12.27.4.2 close_button

```
Gtk::Button trisycl::vendor::xilinx::graphics::frame_grid::close_button { "Close" }
```

A close button in case the closing function is not provided by the window manager.

Definition at line 65 of file graphics.hpp.

Referenced by frame_grid().

12.27.4.3 done

```
std::atomic< bool > trisycl::vendor::xilinx::graphics::frame_grid::done = false
```

Set to true by the closing handler.

Definition at line 81 of file graphics.hpp.

Referenced by trisycl::vendor::xilinx::graphics::image_grid::image_grid(), trisycl::vendor::xilinx::graphics::image_grid::is_done_barrier(
and trisycl::vendor::xilinx::graphics::image_grid::submit().

12.27.4.4 frames

```
std::vector< Gtk::Frame > trisycl::vendor::xilinx::graphics::frame_grid::frames
```

The linearized 2D vector of frames used to decorate the tile images with some frames with the tile names.

Definition at line 69 of file graphics.hpp.

Referenced by frame_grid(), and get_frame().

12.27.4.5 grid

```
Gtk::Grid trisycl::vendor::xilinx::graphics::frame_grid::grid
```

The container to represent the grid of tile images.

Definition at line 61 of file graphics.hpp.

Referenced by frame_grid().

12.27.4.6 nx

```
int trisycl::vendor::xilinx::graphics::frame_grid::nx
```

Number of frame columns.

Definition at line 72 of file graphics.hpp.

Referenced by frame_grid(), get_frame(), trisycl::vendor::xilinx::graphics::image_grid::image_grid(), and trisycl::vendor::xilinx::graphics::image_grid::update_tile_data_image().

12.27.4.7 ny

```
int trisycl::vendor::xilinx::graphics::frame_grid::ny
```

Number of frame lines.

Definition at line 75 of file graphics.hpp.

Referenced by frame_grid(), and trisycl::vendor::xilinx::graphics::image_grid::image_grid().

12.27.4.8 sw

```
Gtk::ScrolledWindow trisycl::vendor::xilinx::graphics::frame_grid::sw
```

Nice to have some scroll bars around when the main window is too small.

Definition at line 58 of file graphics.hpp.

Referenced by frame_grid().

12.36.1 Detailed Description

SYCL host device.

Todo The implementation is quite minimal for now. :-)

Definition at line 29 of file host_device.hpp.

12.36.2 Member Function Documentation

12.36.2.1 get()

```
cl_device_id trisycl::detail::host_device::get ( ) const  [inline], [override], [virtual]
```

Return the cl_device_id of the underlying OpenCL platform.

This throws an error since there is no OpenCL device associated to the host device.

Implements trisycl::detail::device.

Definition at line 40 of file host_device.hpp.

```
00040                                 {
00041     throw non_cl_error("The host device has no OpenCL device");
00042   }
```

12.36.2.2 get_boost_compute()

```
boost::compute::device & trisycl::detail::host_device::get_boost_compute ( )  [inline], [override],
[virtual]
```

Return the underlying Boost.Compute device.

This throws an error since there is no OpenCL device associated to the host device.

Implements trisycl::detail::device.

Definition at line 50 of file host_device.hpp.

```
00050                                                {
00051     throw non_cl_error("The host device has no underlying OpenCL device");
00052   }
```

12.36.2.3 get_info()

```
std::any trisycl::detail::host_device::get_info (
            info::device param ) const  [inline], [override], [virtual]
```

Query the device for OpenCL info::device info.

Implements trisycl::detail::device.

Definition at line 100 of file host_device.hpp.

```
00100                                            {
00101     switch (param) {
00102     TRISYCL_DEFINE_DEVICE_HOST_INFO_TEMPLATE(max_work_group_size, static_cast<std::size_t>(8))
00103     TRISYCL_DEFINE_DEVICE_HOST_INFO_TEMPLATE(max_work_item_sizes, (trisycl::id<3>{ 128, 128, 128 }))
00104     TRISYCL_DEFINE_DEVICE_HOST_INFO_TEMPLATE(max_compute_units, static_cast<trisycl::cl_uint>(8))
00105     TRISYCL_DEFINE_DEVICE_HOST_INFO_TEMPLATE(device_type, info::device_type::host)
00106     TRISYCL_DEFINE_DEVICE_HOST_INFO_TEMPLATE(local_mem_type, info::local_mem_type::global)
00107     TRISYCL_DEFINE_DEVICE_HOST_INFO_TEMPLATE(local_mem_size, static_cast<trisycl::cl_ulong>(32768))
00108     default:
00109       return 0;
00110     }
00111   }
```

References trisycl::info::global, trisycl::info::host, and TRISYCL_DEFINE_DEVICE_HOST_INFO_TEMPLATE.

12.36.2.4 get_platform()

```
trisycl::platform trisycl::detail::host_device::get_platform ( ) const  [inline], [override],
[virtual]
```

Return the platform of device.

Return synchronous errors via the SYCL exception class.

Todo To be implemented

Implements trisycl::detail::device.

Definition at line 86 of file host_device.hpp.

```
00086                                            {
00087     TRISYCL_UNIMPL;
00088     return {};
00089   }
```

References TRISYCL_UNIMPL.

12.36.2.5 has_extension()

```
bool trisycl::detail::host_device::has_extension (
            const string_class & extension ) const  [inline], [override], [virtual]
```

Specify whether a specific extension is supported on the device.

Todo To be implemented

Implements trisycl::detail::device.

Definition at line 117 of file host_device.hpp.

```
00117                                                                    {
00118     TRISYCL_UNIMPL;
00119     return {};
00120   }
```

References TRISYCL_UNIMPL.

12.36.2.6 is_accelerator()

```
bool trisycl::detail::host_device::is_accelerator ( ) const  [inline], [override], [virtual]
```

Return false since the host device is not an OpenCL accelerator device.

Implements trisycl::detail::device.

Definition at line 75 of file host_device.hpp.

```
00075                                    {
00076     return false;
00077   }
```

12.36.2.7 is_cpu()

```
bool trisycl::detail::host_device::is_cpu ( ) const  [inline], [override], [virtual]
```

Return false since the host device is not an OpenCL CPU device.

Implements trisycl::detail::device.

Definition at line 63 of file host_device.hpp.

```
00063                                {
00064     return false;
00065   }
```

12.36.2.8 is_gpu()

```
bool trisycl::detail::host_device::is_gpu ( ) const  [inline], [override], [virtual]
```

Return false since the host device is not an OpenCL GPU device.

Implements trisycl::detail::device.

Definition at line 69 of file host_device.hpp.

```
00069                                {
00070     return false;
00071   }
```

12.36.2.9 is_host()

```
bool trisycl::detail::host_device::is_host ( ) const  [inline], [override], [virtual]
```

Return true since the device is a SYCL host device.

Implements trisycl::detail::device.

Definition at line 57 of file host_device.hpp.

```
00057                                {
00058     return true;
00059   }
```

  Claim proudly that the queue is executing on the SYCL host device.

Additional Inherited Members

12.38.1 Detailed Description

Some implementation details about the SYCL queue.

Note that a host queue is not a singleton, compared to host device or host platform, for example.

Definition at line 28 of file host_queue.hpp.

12.38.2 Member Function Documentation

12.38.2.1 get()

```
cl_command_queue trisycl::detail::host_queue::get ( ) const  [inline], [override], [private],
[virtual]
```

Return the cl_command_queue of the underlying OpenCL queue.

This throws an error since there is no OpenCL queue associated to the host queue.

Implements trisycl::detail::queue.

Definition at line 37 of file host_queue.hpp.

```
00037                                       {
00038     throw non_cl_error("The host queue has no OpenCL command queue");
00039   }
```

12.38.2.2 get_boost_compute()

```
boost::compute::command_queue & trisycl::detail::host_queue::get_boost_compute ( )  [inline],
[override], [private], [virtual]
```

Return the underlying Boost.Compute command queue.

This throws an error since there is no OpenCL queue associated to the host queue.

Implements trisycl::detail::queue.

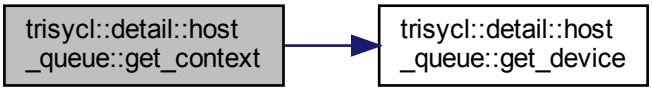
Definition at line 47 of file host_queue.hpp.

```
00047                                                       {
00048     throw non_cl_error("The host queue has no OpenCL command queue");
00049   }
```

12.38.2.3 get_context()

```
trisycl::context trisycl::detail::host_queue::get_context ( ) const  [inline], [override],
[private], [virtual]
```

Return the SYCL host queue's host context.



Implements trisycl::detail::queue.

Definition at line 54 of file host_queue.hpp.

```
00054                                          {
00055     // Return the default context for the default device
00056     // which is the host context
00057     return { get_device() };
00058   }
```

References get_device().

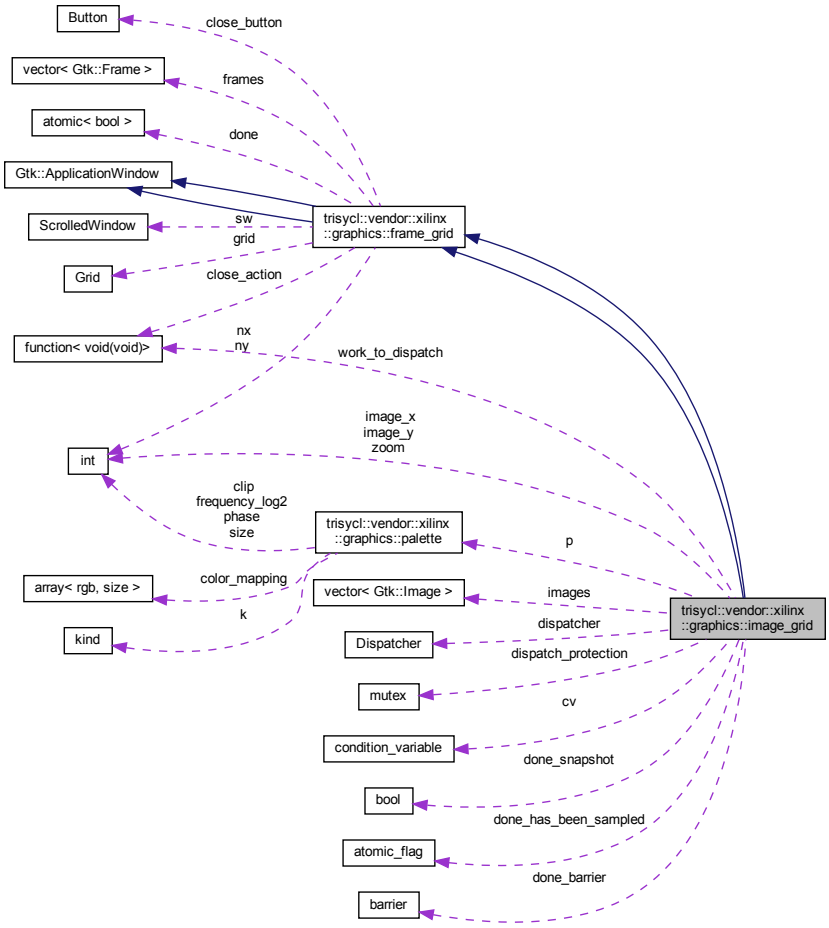
12.39 trisycl::vendor::xilinx::graphics::image_grid Struct Reference



An application window displaying a grid of tiled images.

```
#include <graphics.hpp>
```

Inheritance diagram for trisycl::vendor::xilinx::graphics::image_grid:

Collaboration diagram for trisycl::vendor::xilinx::graphics::image_grid:

Public Member Functions

- image_grid (int nx, int ny, int image_x, int image_y, int zoom)

  Create a grid of tiled images.
- bool on_key_press_event (GdkEventKey ∗event) override

  Deal with the key pressed.
- void submit (std::function< void(void)> f)

  Submit some work to the graphics thread.
- template<typename MDspan , typename RangeValue , typename = typename MDspan::extents_type>
  void update_tile_data_image (int x, int y, const MDspan &data, RangeValue min_value, RangeValue max_↩
  value)

  Update the image of a tile.
- template<typename DataType , typename RangeValue >
  void update_tile_data_image (int x, int y, const DataType ∗data, RangeValue min_value, RangeValue max↩
  _value)

  Update the image of a tile of size image_y by image_x from a pointer.
- palette & get_palette ()

  Return the palette used to render the value.
- bool is_done_barrier ()

Test if the window has been closed after synchronizing with a barrier accross all the tiles.

- image_grid (int nx, int ny, int image_x, int image_y, int zoom)

  Create a grid of tiled images.
- bool on_key_press_event (GdkEventKey *event) override

  Deal with the key pressed.
- void submit (std::function< void(void)> f)

  Submit some work to the graphics thread.
- template<typename MDspan , typename RangeValue , typename = typename MDspan::extents_type>
  void update_tile_data_image (int x, int y, const MDspan &data, RangeValue min_value, RangeValue max_↩
  value)

  Update the image of a tile.
- template<typename DataType , typename RangeValue >
  void update_tile_data_image (int x, int y, const DataType *data, RangeValue min_value, RangeValue max↩
  _value)

  Update the image of a tile of size image_y by image_x from a pointer.
- palette & get_palette ()

  Return the palette used to render the value.
- bool is_done_barrier ()

  Test if the window has been closed after synchronizing with a barrier accross all the tiles.

Public Attributes

- std::vector< Gtk::Image > images

  The linearized 2D vector of images.
- int image_x

  Horizontal image size in pixels.
- int image_y

  Vertical image size in pixels.
- int zoom

  The image pixel zooming factor for both dimension.
- Glib::Dispatcher dispatcher

  Dispatcher to invoke something in the graphics thread in a safe way.
- std::mutex dispatch_protection

  Protection against concurrent update.
- std::condition_variable cv

  The condition variable used to queue up graphics update submission.
- std::function< void(void)> work_to_dispatch

  What to dispatch.
- palette p

  The RGB palette used to render the image values.
- bool done_snapshot

  A global done state across all the tile to allow a global shutdown.
- std::atomic_flag done_has_been_sampled

  Set to true once "done" state has been sampled.
- boost::barrier done_barrier { static_cast<unsigned int>(nx*ny) }

  Barrier to compute the global done state across the tiles.

12.39.1 Detailed Description

An application window displaying a grid of tiled images.

Definition at line 372 of file graphics.hpp.

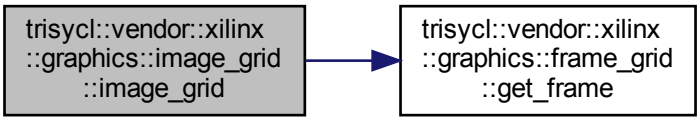
12.39.2 Constructor & Destructor Documentation

12.39.2.1 image_grid() [1/2]

```
trisycl::vendor::xilinx::graphics::image_grid::image_grid (
            int nx,
            int ny,
            int image_x,
            int image_y,
            int zoom )  [inline]
```

Create a grid of tiled images.

Parameters



in	*nx*	is the numer of tiles horizontally
in	*ny*	is the numer of tiles vertically
in	*image_x*	is the horizontal image pixel size
in	*image_y*	is the vertical image pixel size
in	*zoom*	is the zooming factor applied to image pixels, both horizontally and vertically

Definition at line 422 of file graphics.hpp.

```
00423     :  frame_grid { nx , ny }
00424     , image_x { image_x }
00425     , image_y { image_y }
00426     , zoom { zoom }
00427   {
00428     for (int y = 0; y < ny; ++y)
00429       for (int x = 0; x < nx; ++x) {
00430         auto &f = get_frame(x, y);

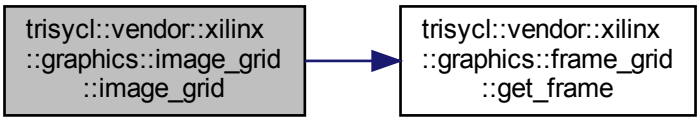
12.39.2.2 image_grid() [2/2]

```
trisycl::vendor::xilinx::graphics::image_grid::image_grid (
              int nx,
              int ny,
              int image_x,
              int image_y,
              int zoom )  [inline]
```

Create a grid of tiled images.

Parameters

in	*nx*	is the numer of tiles horizontally
in	*ny*	is the numer of tiles vertically
in	*image_x*	is the horizontal image pixel size
in	*image_y*	is the vertical image pixel size
in	*zoom*	is the zooming factor applied to image pixels, both horizontally and vertically



Definition at line 422 of file graphics.hpp.

```
00423     :  frame_grid { nx , ny }

12.39.3 Member Function Documentation

12.39.3.1 get_palette() [1/2]

```
palette & trisycl::vendor::xilinx::graphics::image_grid::get_palette ( )  [inline]
```

Return the palette used to render the value.

Definition at line 571 of file graphics.hpp.

```
00571                                {
00572     return p;
00573   }
```

References p.

12.39.3.2 get_palette() [2/2]

```
palette & trisycl::vendor::xilinx::graphics::image_grid::get_palette ( )  [inline]
```

Return the palette used to render the value.

Definition at line 571 of file graphics.hpp.

```
00571                                {
00572     return p;
00573   }
```

References p.

12.39.3.3 is_done_barrier() [1/2]

```
bool trisycl::vendor::xilinx::graphics::image_grid::is_done_barrier ( )  [inline]
```

Test if the window has been closed after synchronizing with a barrier accross all the tiles.

Definition at line 578 of file graphics.hpp.

```
00578                                {
00579     // Only 1 thread sample the graphics status
00580     if (done_has_been_sampled.test_and_set())
00581       done_snapshot = done;
00582     // Then wait for everybody to synchronize
00583     done_barrier.count_down_and_wait();
00584     // Reinitialize the flag for the next iteration
00585     done_has_been_sampled.clear();
00586     return done_snapshot;
00587   }
```

References trisycl::vendor::xilinx::graphics::frame_grid::done, done_barrier, done_has_been_sampled, and done_snapshot.

12.39.3.4 is_done_barrier() [2/2]

```
bool trisycl::vendor::xilinx::graphics::image_grid::is_done_barrier ( )  [inline]
```

Test if the window has been closed after synchronizing with a barrier accross all the tiles.

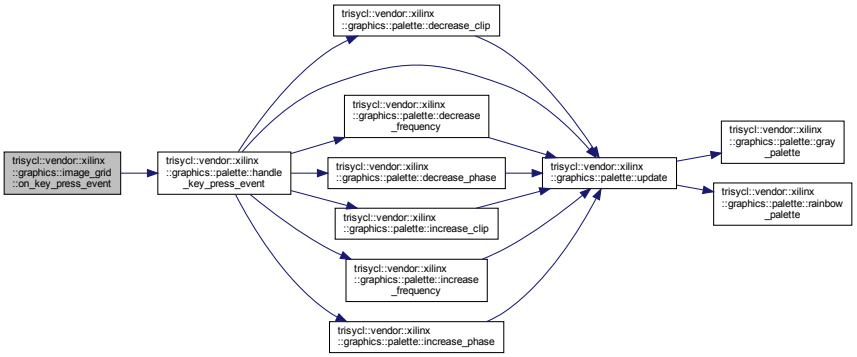
Definition at line 578 of file graphics.hpp.

```
00578                                {
00579     // Only 1 thread sample the graphics status
00580     if (done_has_been_sampled.test_and_set())
00581       done_snapshot = done;
00582     // Then wait for everybody to synchronize
00583     done_barrier.count_down_and_wait();
00584     // Reinitialize the flag for the next iteration
00585     done_has_been_sampled.clear();
00586     return done_snapshot;
00587   }
```

References trisycl::vendor::xilinx::graphics::frame_grid::done, done_barrier, done_has_been_sampled, and done_snapshot.

12.39.3.5 on_key_press_event() [1/2]

```
bool trisycl::vendor::xilinx::graphics::image_grid::on_key_press_event (
            GdkEventKey * event )  [inline], [override]
```



Deal with the key pressed.

Definition at line 467 of file graphics.hpp.

```
00467                                                   {
00468     // Forward to the palette for action
00469     return p.handle_key_press_event(*event);
00470   }
```

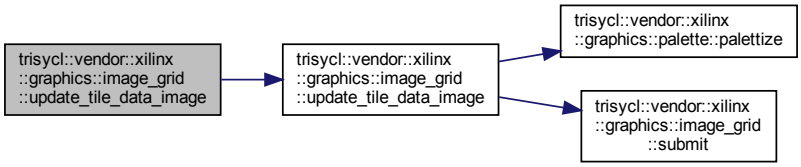
12.39.3.9 update_tile_data_image() [1/4]

```
template<typename DataType , typename RangeValue >
void trisycl::vendor::xilinx::graphics::image_grid::update_tile_data_image (
            int x,
            int y,
            const DataType * data,
            RangeValue min_value,
            RangeValue max_value )  [inline]
```

Update the image of a tile of size image_y by image_x from a pointer.

Parameters



in	*x*	is the tile horizontal id
in	*y*	is the tile vertical id
in	*data*	is a pointer to the pixels to be drawns
in	*min_value*	is the value represented with minimum of graphics palette color
in	*max_value*	is the value represented with maximum of graphics palette color

Definition at line 560 of file graphics.hpp.

```
00563                                                  {

Here is the call graph for this function:

12.39.4 Member Data Documentation

12.39.4.1 cv

`std::condition_variable trisycl::vendor::xilinx::graphics::image_grid::cv`

The condition variable used to queue up graphics update submission.

Definition at line 392 of file graphics.hpp.

Referenced by image_grid(), and submit().

12.39.4.2 dispatch_protection

```
std::mutex trisycl::vendor::xilinx::graphics::image_grid::dispatch_protection
```

Protection against concurrent update.

Definition at line 389 of file graphics.hpp.

Referenced by image_grid(), and submit().

12.39.4.3 dispatcher

```
Glib::Dispatcher trisycl::vendor::xilinx::graphics::image_grid::dispatcher
```

Dispatcher to invoke something in the graphics thread in a safe way.

Definition at line 386 of file graphics.hpp.

Referenced by image_grid(), and submit().

12.39.4.4 done_barrier

```
boost::barrier trisycl::vendor::xilinx::graphics::image_grid::done_barrier { static_cast<unsigned
int>(nx*ny) }
```

Barrier to compute the global done state across the tiles.

Definition at line 407 of file graphics.hpp.

Referenced by is_done_barrier().

12.39.4.5 done_has_been_sampled

```
std::atomic_flag trisycl::vendor::xilinx::graphics::image_grid::done_has_been_sampled
```

Set to true once "done" state has been sampled.

Definition at line 404 of file graphics.hpp.

Referenced by is_done_barrier().

12.39.4.6 done_snapshot

```
bool trisycl::vendor::xilinx::graphics::image_grid::done_snapshot
```

A global done state across all the tile to allow a global shutdown.

Definition at line 401 of file graphics.hpp.

Referenced by is_done_barrier().

12.39.4.7 image_x

```
int trisycl::vendor::xilinx::graphics::image_grid::image_x
```

Horizontal image size in pixels.

Definition at line 377 of file graphics.hpp.

Referenced by image_grid(), and update_tile_data_image().

12.39.4.8 image_y

```
int trisycl::vendor::xilinx::graphics::image_grid::image_y
```

Vertical image size in pixels.

Definition at line 380 of file graphics.hpp.

Referenced by image_grid(), and update_tile_data_image().

12.39.4.9 images

```
std::vector< Gtk::Image > trisycl::vendor::xilinx::graphics::image_grid::images
```

The linearized 2D vector of images.

Definition at line 374 of file graphics.hpp.

Referenced by image_grid(), and update_tile_data_image().

12.39.4.10 p

```
palette trisycl::vendor::xilinx::graphics::image_grid::p
```

The RGB palette used to render the image values.

Definition at line 398 of file graphics.hpp.

Referenced by get_palette(), on_key_press_event(), and update_tile_data_image().

12.39.4.11 work_to_dispatch

```
std::function< void(void)> trisycl::vendor::xilinx::graphics::image_grid::work_to_dispatch
```

What to dispatch.

Definition at line 395 of file graphics.hpp.

Referenced by image_grid(), and submit().

12.39.4.12 zoom

```
int trisycl::vendor::xilinx::graphics::image_grid::zoom
```

The image pixel zooming factor for both dimension.

Definition at line 383 of file graphics.hpp.

Referenced by image_grid(), and update_tile_data_image().

12.46 trisycl::vendor::xilinx::acap::aie::lock_unit::locking_device Struct Reference

The individual locking system.

`#include <lock.hpp>`

Collaboration diagram for trisycl::vendor::xilinx::acap::aie::lock_unit::locking_device:

Public Types

- using value_t = bool

  The type of the value stored in the locking device.
- using value_t = bool

  The type of the value stored in the locking device.

Public Member Functions

- void acquire ()

  Lock the mutex.
- void release ()

  Unlock the mutex.
- void acquire_with_value (value_t expectation)

  Wait until the internal value has the expectation.
- void release_with_value (value_t new_value)

  Release and update with a new internal value.
- void acquire ()

  Lock the mutex.
- void release ()

  Unlock the mutex.
- void acquire_with_value (value_t expectation)

  Wait until the internal value has the expectation.
- void release_with_value (value_t new_value)

  Release and update with a new internal value.

Public Attributes

- std::unique_ptr< boost::fibers::mutex > m { new boost::fibers::mutex { } }

  The mutex to provide the basic protection mechanism.
- std::unique_ptr< boost::fibers::condition_variable > cv

  The condition variable to wait/notify for some value.
- value_t value = false

  The value to be waited for, initialized to false on reset.

12.46.1 Detailed Description

The individual locking system.

Definition at line 44 of file lock.hpp.

12.46.2 Member Typedef Documentation

12.46.2.1 value_t [1/2]

```
using trisycl::vendor::xilinx::acap::aie::lock_unit::locking_device::value_t = bool
```

The type of the value stored in the locking device.

Definition at line 46 of file lock.hpp.

12.46.2.2 value_t [2/2]

```
using trisycl::vendor::xilinx::acap::aie::lock_unit::locking_device::value_t = bool
```

The type of the value stored in the locking device.

Definition at line 46 of file lock.hpp.

00092     }
```

References cv, m, and value.

12.46.4 Member Data Documentation

12.46.4.1 cv

```
std::unique_ptr< boost::fibers::condition_variable > trisycl::vendor::xilinx::acap::aie↩
::lock_unit::locking_device::cv
```

Initial value:

```
{
      new boost::fibers::condition_variable { } }
```

The condition variable to wait/notify for some value.

Definition at line 59 of file lock.hpp.

Referenced by acquire_with_value(), and release_with_value().

12.46.4.2 m

```
std::unique_ptr< boost::fibers::mutex > trisycl::vendor::xilinx::acap::aie::lock_unit::locking↩
_device::m { new boost::fibers::mutex { } }
```

The mutex to provide the basic protection mechanism.

Definition at line 56 of file lock.hpp.

Referenced by acquire(), acquire_with_value(), release(), and release_with_value().

12.46.4.3 value

```
value_t trisycl::vendor::xilinx::acap::aie::lock_unit::locking_device::value = false
```

The value to be waited for, initialized to false on reset.

Definition at line 63 of file lock.hpp.

Referenced by acquire_with_value(), and release_with_value().

12.47 trisycl::vendor::xilinx::partition::none Struct Reference

Represent a none partition.

```
#include <partition_array.hpp>
```

Collaboration diagram for trisycl::vendor::xilinx::partition::none:

Static Public Attributes

- static constexpr auto partition_type = type::none

12.47.1 Detailed Description

Represent a none partition.

The single array would be the same as std::array.

Definition at line 129 of file partition_array.hpp.

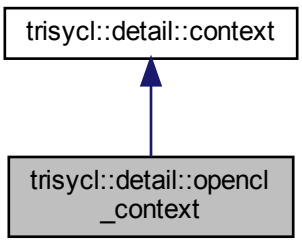
12.47.2 Member Data Documentation

12.47.2.1 partition_type

```
static constexpr auto trisycl::vendor::xilinx::partition::none::partition_type = type::none
[static], [constexpr]
```

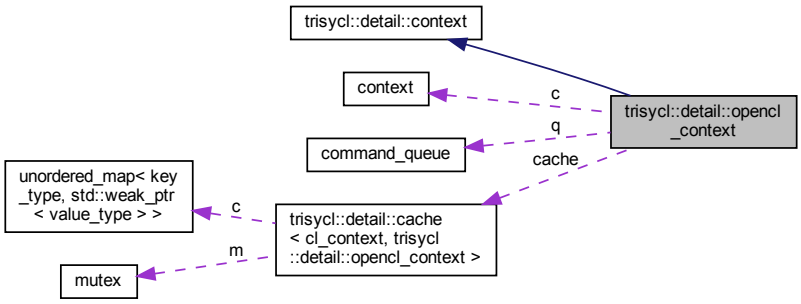
Definition at line 130 of file partition_array.hpp.

The documentation for this struct was generated from the following files:



- include/sycl/vendor/Xilinx/fpga/partition_array.hpp
- include/triSYCL/vendor/Xilinx/fpga/partition_array.hpp

12.48 trisycl::detail::opencl_context Class Reference



SYCL OpenCL context.

```
#include <opencl_context.hpp>
```

Inheritance diagram for trisycl::detail::opencl_context:

Collaboration diagram for trisycl::detail::opencl_context:

Public Member Functions

- cl_context get () const override

  Return the underlying `cl_context` of the `trisycl::context`.
- boost::compute::context & get_boost_compute () override

  Return the underlying `boost::compute::context` of the `trisycl::context`.
- boost::compute::command_queue & get_boost_queue () override

  Return the queue that is associated to the context.
- bool is_host () const override

  Return false because the context is not a SYCL host context.
- trisycl::platform get_platform () const override

  Return the platform of the context.
- vector_class< trisycl::device > get_devices () const override

  Returns the set of devices that are part of this context.
- trisycl::cl_uint get_reference_count () const override

  Returns the reference count of underlying CL context, or 0 on host.
- ~opencl_context () override

  Unregister from the cache on destruction.

Static Public Member Functions

- static std::shared_ptr< opencl_context > instance (const boost::compute::context &c)

  Get a singleton instance of the `opencl_context`.

Private Member Functions

- opencl_context (const boost::compute::context &c)

  Only the instance factory can build it.

Private Attributes

- boost::compute::context c

  User the Boost Compute abstraction of the OpenCL context.
- boost::compute::command_queue q

  A boost `command_queue` associated to an OpenCL context for when we need to transfer data but no queue is given (eg.

Static Private Attributes

- static detail::cache< cl_context, detail::opencl_context > cache

  A cache to always return the same alive context for a given OpenCL context.

12.48.1 Detailed Description

SYCL OpenCL context.

Definition at line 28 of file opencl_context.hpp.

12.48.2 Constructor & Destructor Documentation

12.48.2.1 opencl_context()

```
trisycl::detail::opencl_context::opencl_context (
            const boost::compute::context & c )  [inline], [private]
```

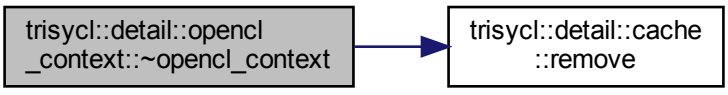
Only the instance factory can build it.

Definition at line 126 of file opencl_context.hpp.

```
00126                                          :
00127     c { c },
00128     q { boost::compute::command_queue { c, c.get_device() } } {}
```

12.48.2.2 ~opencl_context()

```
trisycl::detail::opencl_context::~opencl_context ( )  [inline], [override]
```



Unregister from the cache on destruction.

Definition at line 133 of file opencl_context.hpp.

```
00133                                  {
00134     cache.remove(c.get());
00135   }
```

References c, and trisycl::detail::cache< Key, Value >::remove().

Here is the call graph for this function:

12.48.3 Member Function Documentation

12.48.3.1 get()

```
cl_context trisycl::detail::opencl_context::get ( ) const  [inline], [override], [virtual]
```

Return the underlying `cl_context` of the `trisycl::context`.

Implements trisycl::detail::context.

Definition at line 49 of file opencl_context.hpp.

```
00049                                    {
00050     return c.get();
00051   }
```

References c.

12.48.3.2 get_boost_compute()

```
boost::compute::context & trisycl::detail::opencl_context::get_boost_compute ( )  [inline],
[override], [virtual]
```

Return the underlying `boost::compute::context` of the `trisycl::context`.

Implements trisycl::detail::context.

Definition at line 57 of file opencl_context.hpp.

```
00057                                                {
00058     return c;
00059   }
```

References c.

12.48.3.3 get_boost_queue()

```
boost::compute::command_queue & trisycl::detail::opencl_context::get_boost_queue ( )  [inline],
[override], [virtual]
```

Return the queue that is associated to the context.

Implements trisycl::detail::context.

Definition at line 63 of file opencl_context.hpp.

```
00063                                                    {
00064     return q;
00065   }
```

References q.

12.48.3.4 get_devices()

```
vector_class< trisycl::device > trisycl::detail::opencl_context::get_devices ( ) const  [inline],
[override], [virtual]
```

Returns the set of devices that are part of this context.

Todo To be implemented

Implements trisycl::detail::context.

Definition at line 103 of file opencl_context.hpp.

```
00103                                                  {
00104     vector_class<trisycl::device> devices;
00105
00106     for (const auto &d :  c.get_devices())
00107       devices.push_back(d);
00108     return devices;
00109   }
```

References c.

12.48.3.5 get_platform()

```
trisycl::platform trisycl::detail::opencl_context::get_platform ( ) const  [inline], [override],
[virtual]
```

Return the platform of the context.

Return synchronous errors via the SYCL exception class.

Todo To be implemented

Implements trisycl::detail::context.

Definition at line 94 of file opencl_context.hpp.

```
00094                                              {
00095     return trisycl::platform(c.get_devices()[0].platform());
00096   }
```

References c.

12.48.3.6 get_reference_count()

```
trisycl::cl_uint trisycl::detail::opencl_context::get_reference_count ( ) const  [inline],
[override], [virtual]
```

Returns the reference count of underlying CL context, or 0 on host.

Implements trisycl::detail::context.

Definition at line 111 of file opencl_context.hpp.

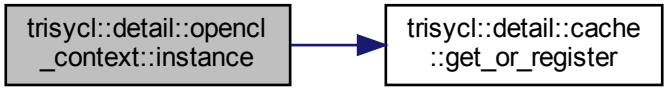
```
00111                                                  {
00112     return c.get_info<CL_CONTEXT_REFERENCE_COUNT>();
00113   }
```

References c.

12.48.3.7 instance()

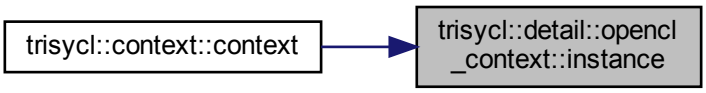
```
static std::shared_ptr< opencl_context > trisycl::detail::opencl_context::instance (
            const boost::compute::context & c )  [inline], [static]
```

Get a singleton instance of the opencl_context.



Definition at line 117 of file opencl_context.hpp.

```
00117                                                {
00118     return cache.get_or_register(c.get(),
00119                                  [&] { return new opencl_context { c }; });
00120   }
```



References c, and trisycl::detail::cache< Key, Value >::get_or_register().

Referenced by trisycl::context::context().

Here is the call graph for this function:

Here is the caller graph for this function:

12.48.3.8 is_host()

```
bool trisycl::detail::opencl_context::is_host ( ) const  [inline], [override], [virtual]
```

Return false because the context is not a SYCL host context.

Implements trisycl::detail::context.

Definition at line 69 of file opencl_context.hpp.

```
00069                                  {
00070     return false;
00071   }
```

12.48.4 Member Data Documentation

12.48.4.1 c

```
boost::compute::context trisycl::detail::opencl_context::c  [private]
```

User the Boost Compute abstraction of the OpenCL context.

Definition at line 31 of file opencl_context.hpp.

Referenced by get(), get_boost_compute(), get_devices(), get_platform(), get_reference_count(), and instance().

12.48.4.2 cache

```
detail::cache<cl_context, detail::opencl_context> trisycl::detail::opencl_context::cache
[static], [private]
```

A cache to always return the same alive context for a given OpenCL context.

C++11 guaranties the static construction is thread-safe

Definition at line 44 of file opencl_context.hpp.

12.48.4.3 q

```
boost::compute::command_queue trisycl::detail::opencl_context::q  [private]
```

A boost `command_queue` associated to an OpenCL context for when we need to transfer data but no queue is given (eg.

When an buffer accessor is created)

Definition at line 37 of file opencl_context.hpp.

Referenced by get_boost_queue().

The documentation for this class was generated from the following file:

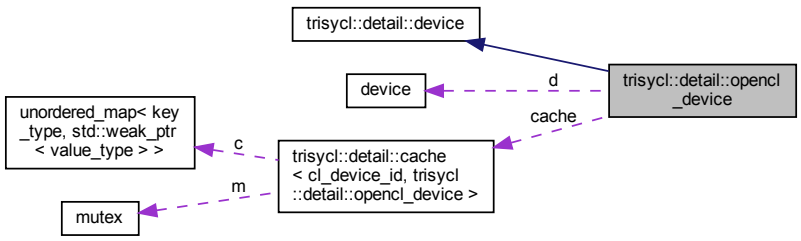
12.49 trisycl::detail::opencl_device Class Reference



SYCL OpenCL device.

`#include <opencl_device.hpp>`

Inheritance diagram for trisycl::detail::opencl_device:

Collaboration diagram for trisycl::detail::opencl_device:

Public Member Functions

- cl_device_id get () const override

  Return the cl_device_id of the underlying OpenCL device.
- boost::compute::device & get_boost_compute () override

  Return the underlying Boost.Compute device.
- bool is_host () const override

  Return false since an OpenCL device is not the SYCL host device.
- bool is_cpu () const override

  Test if the OpenCL is a CPU device.
- bool is_gpu () const override

  Test if the OpenCL is a GPU device.
- bool is_accelerator () const override

  Test if the OpenCL is an accelerator device.

- trisycl::platform get_platform () const override
  Return the platform of device.
- std::any get_info (info::device param) const override
  Query the device for OpenCL info::device info.
- bool has_extension (const string_class &extension) const override
  Specify whether a specific extension is supported on the device.
- ~opencl_device () override
  Unregister from the cache on destruction.

Static Public Member Functions

- static std::shared_ptr< opencl_device > instance (const boost::compute::device &d)

Private Member Functions

- template<info::device param>
  std::any get_info () const
- opencl_device (const boost::compute::device &d)
  Only the instance factory can build it.

Private Attributes

- boost::compute::device d
  Use the Boost Compute abstraction of the OpenCL device.

Static Private Attributes

- static detail::cache< cl_device_id, detail::opencl_device > cache
  A cache to always return the same alive device for a given OpenCL device.

12.49.1 Detailed Description

SYCL OpenCL device.

Definition at line 28 of file opencl_device.hpp.

12.49.2 Constructor & Destructor Documentation

12.49.2.1 opencl_device()

```
trisycl::detail::opencl_device::opencl_device (
            const boost::compute::device & d )  [inline], [private]
```

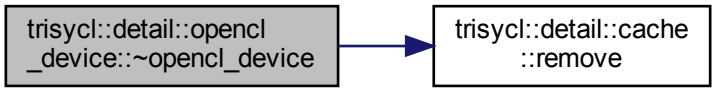
Only the instance factory can build it.

Definition at line 114 of file opencl_device.hpp.

```
00114 :  d { d } {}
```

12.49.2.2 ~opencl_device()

```
trisycl::detail::opencl_device::~opencl_device ( )  [inline], [override]
```



Unregister from the cache on destruction.

Definition at line 119 of file opencl_device.hpp.

```
00119                                {
00120     cache.remove(d.id());
00121   }
```

References trisycl::detail::cache< Key, Value >::remove().

12.49.3.5 get_platform()

trisycl::platform trisycl::detail::opencl_device::get_platform ( ) const [inline], [override],

[virtual]

Return the platform of device.

Return synchronous errors via the SYCL exception class.

Implements trisycl::detail::device.

Definition at line 85 of file opencl_device.hpp.

```
00085                                                {
00086     return d.platform();
00087   }
```

References d.

12.49.3.6 has_extension()

```
bool trisycl::detail::opencl_device::has_extension (
            const string_class & extension ) const  [inline], [override], [virtual]
```

Specify whether a specific extension is supported on the device.

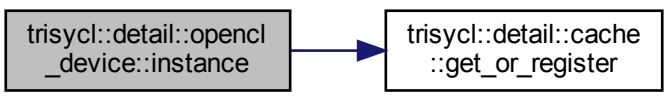
Implements trisycl::detail::device.

Definition at line 97 of file opencl_device.hpp.

```
00097                                                                {
00098     return d.supports_extension(extension);
00099   }
```

References d.

12.49.3.7 instance()



```
static std::shared_ptr< opencl_device > trisycl::detail::opencl_device::instance (
            const boost::compute::device & d )  [inline], [static]
```

Definition at line 104 of file opencl_device.hpp.

```
00104                                          {
00105     return cache.get_or_register(d.id(),
00106                                  [&] { return new opencl_device { d }; });
00107   }
```

References d, and trisycl::detail::cache< Key, Value >::get_or_register().

Here is the call graph for this function:

12.49.3.8 is_accelerator()

```
bool trisycl::detail::opencl_device::is_accelerator ( ) const  [inline], [override], [virtual]
```

Test if the OpenCL is an accelerator device.

Implements trisycl::detail::device.

Definition at line 75 of file opencl_device.hpp.

```
00075                                        {
00076     // Even in Boost.Compute the type is a bit-field, so use & instead of ==
00077     return d.type() & boost::compute::device::accelerator;
00078   }
```

References d.

12.49.3.9 is_cpu()

```
bool trisycl::detail::opencl_device::is_cpu ( ) const  [inline], [override], [virtual]
```

Test if the OpenCL is a CPU device.

Implements trisycl::detail::device.

Definition at line 61 of file opencl_device.hpp.

```
00061                                    {
00062     // Even in Boost.Compute the type is a bit-field, so use & instead of ==
00063     return d.type() & boost::compute::device::cpu;
00064   }
```

References d.

12.49.3.10 is_gpu()

```
bool trisycl::detail::opencl_device::is_gpu ( ) const  [inline], [override], [virtual]
```

Test if the OpenCL is a GPU device.

Implements trisycl::detail::device.

Definition at line 68 of file opencl_device.hpp.

```
00068                                    {
00069     // Even in Boost.Compute the type is a bit-field, so use & instead of ==
00070     return d.type() & boost::compute::device::gpu;
00071   }
```

References d.

12.49.3.11 is_host()

```
bool trisycl::detail::opencl_device::is_host ( ) const  [inline], [override], [virtual]
```

Return false since an OpenCL device is not the SYCL host device.

Implements trisycl::detail::device.

Definition at line 55 of file opencl_device.hpp.

```
00055                                {
00056     return false;
00057   }
```

12.49.4 Member Data Documentation

12.49.4.1 cache

```
detail::cache<cl_device_id, detail::opencl_device> trisycl::detail::opencl_device::cache
[static], [private]
```

A cache to always return the same alive device for a given OpenCL device.

C++11 guaranties the static construction is thread-safe

Definition at line 38 of file opencl_device.hpp.

12.49.4.2 d

```
boost::compute::device trisycl::detail::opencl_device::d  [private]
```

Use the Boost Compute abstraction of the OpenCL device.

Definition at line 31 of file opencl_device.hpp.

Referenced by get(), get_boost_compute(), get_info(), get_platform(), has_extension(), instance(), is_accelerator(), is_cpu(), and is_gpu().

```

12.51.3 Member Function Documentation

12.51.3.1 get()

```
cl_kernel trisycl::detail::opencl_kernel::get ( ) const  [inline], [override], [virtual]
```

Return the underlying OpenCL object.

Todo Improve the spec to deprecate C OpenCL host API and move to C++ instead to avoid this ugly ownership management

Todo Test error and throw. Externalize this feature in Boost.Compute?

Implements trisycl::detail::kernel.

Definition at line 56 of file opencl_kernel.hpp.

```
00056                                {
00057 /// \todo Test error and throw.  Externalize this feature in Boost.Compute?
00058     clRetainKernel(k);
00059     return k.get();
00060   }
```

12.51.3.2 get_boost_compute()

```
boost::compute::kernel & trisycl::detail::opencl_kernel::get_boost_compute ( )  [inline],
[override], [virtual]
```

Return the Boost.Compute OpenCL kernel object for this kernel.

This is an extension.

Implements trisycl::detail::kernel.

Definition at line 67 of file opencl_kernel.hpp.

```
00067                                                {

00095     cache.remove(q.get());
00096   }
```

References trisycl::detail::cache< Key, Value >::remove().

Here is the call graph for this function:

12.52.3 Member Function Documentation

12.52.3.1 get()

```
cl_command_queue trisycl::detail::opencl_queue::get ( ) const  [inline], [override], [private],
[virtual]
```

Return the cl_command_queue of the underlying OpenCL queue.

Implements trisycl::detail::queue.

Definition at line 34 of file opencl_queue.hpp.

```
00034                                        {
00035     return q.get();
00036   }
```

References q.

12.52.3.2 get_boost_compute()

```
boost::compute::command_queue & trisycl::detail::opencl_queue::get_boost_compute ( )  [inline],
[override], [private], [virtual]
```

Return the underlying Boost.Compute command queue.

Implements trisycl::detail::queue.

Definition at line 40 of file opencl_queue.hpp.

```
00040                                                    {
00041     return q;
00042   }
```

References q.

12.52.3.3 get_context()

```
trisycl::context trisycl::detail::opencl_queue::get_context ( ) const  [inline], [override],
[private], [virtual]
```

Return the SYCL context associated to the queue.

Implements trisycl::detail::queue.

Definition at line 46 of file opencl_queue.hpp.

```
00046                                              {
00047     return q.get_context();
00048   }
```

References q.

12.52.3.4 get_device()

```
trisycl::device trisycl::detail::opencl_queue::get_device ( ) const  [inline], [override],
[private], [virtual]
```

Return the SYCL device associated to the queue.

Implements trisycl::detail::queue.

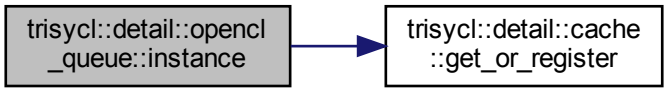
Definition at line 52 of file opencl_queue.hpp.

```
00052                                            {
00053     return q.get_device();
00054   }
```

References q.

12.52.3.5 instance() [1/2]

```
static std::shared_ptr< opencl_queue > trisycl::detail::opencl_queue::instance (
            const boost::compute::command_queue & q )  [inline], [static]
```



Get a singleton instance of the opencl_queue.

Definition at line 71 of file opencl_queue.hpp.

```
00071                                                {
00072     return cache.get_or_register(q.get(),
00073                                  [&] { return new opencl_queue { q }; });
00074   }
```

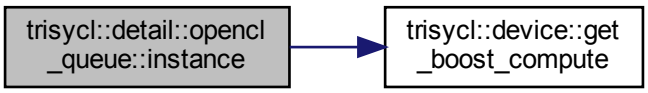
References trisycl::detail::cache< Key, Value >::get_or_register(), and q.

Here is the call graph for this function:

12.52.3.6 instance() [2/2]

```
static std::shared_ptr< detail::queue > trisycl::detail::opencl_queue::instance (
            const trisycl::device & d )  [inline], [static]
```

Create a new queue associated to this device.



Todo Check with SYCL committee what is the expected behaviour here about the context. Is this a new context everytime, or always the same for a given device?

Definition at line 84 of file opencl_queue.hpp.

```
00084                                                {
00085     return instance (boost::compute::command_queue {
00086         // For now, create a new context every time
00087         boost::compute::context { d.get_boost_compute() },
00088         d.get_boost_compute()
00089           });
00090   }
```

References trisycl::device::get_boost_compute().

Here is the call graph for this function:

12.52.3.7 is_host()

```
bool trisycl::detail::opencl_queue::is_host ( ) const  [inline], [override], [private], [virtual]
```

Claim proudly that an OpenCL queue cannot be the SYCL host queue.

Implements trisycl::detail::queue.

Definition at line 58 of file opencl_queue.hpp.

```
00058                                {
00059     return false;
00060   }
```

12.52.4 Member Data Documentation

12.52.4.1 cache

```
detail::cache<cl_command_queue, detail::opencl_queue> trisycl::detail::opencl_queue::cache
[static], [private]
```

A cache to always return the same alive queue for a given OpenCL command queue.

C++11 guaranties the static construction is thread-safe

Definition at line 31 of file opencl_queue.hpp.

12.52.4.2 q

```
boost::compute::command_queue trisycl::detail::opencl_queue::q  [private]
```

Use the Boost Compute abstraction of the OpenCL command queue.

Definition at line 24 of file opencl_queue.hpp.

Referenced by get(), get_boost_compute(), get_context(), get_device(), and instance().
