12.57 trisycl::detail::pooled_shared_work::pool_ctx Struct Reference

Shared storage among the working threads.

`#include <pooled_shared_work.hpp>`

Collaboration diagram for trisycl::detail::pooled_shared_work::pool_ctx:

Public Member Functions

- pool_ctx (bool suspend)

Public Attributes

- const bool suspend_

  Indicate if a thread without work goes to sleep instead of busy-waiting.
- rqueue_type rqueue_ {}

  The global queue storing the runnable fibers.
- std::mutex rqueue_mtx_ {}

  For concurrent access to the global queue.

12.57.1 Detailed Description

Shared storage among the working threads.

```

12.57.3 Member Data Documentation

12.57.3.1 rqueue_

```
rqueue_type trisycl::detail::pooled_shared_work::pool_ctx::rqueue_ {}
```

The global queue storing the runnable fibers.

Definition at line 58 of file pooled_shared_work.hpp.

12.57.3.2 rqueue_mtx_

```
std::mutex trisycl::detail::pooled_shared_work::pool_ctx::rqueue_mtx_ {}
```

For concurrent access to the global queue.

Definition at line 61 of file pooled_shared_work.hpp.

12.57.3.3 suspend_

```
const bool trisycl::detail::pooled_shared_work::pool_ctx::suspend_
```

Indicate if a thread without work goes to sleep instead of busy-waiting.

Definition at line 55 of file pooled_shared_work.hpp.

12.58 trisycl::detail::pooled_work_stealing::pool_ctx Struct Reference

Shared storage among the working threads.

```
#include <pooled_work_stealing.hpp>
```

Collaboration diagram for trisycl::detail::pooled_work_stealing::pool_ctx:

Public Member Functions

- pool_ctx (std::uint32_t thread_count, bool suspend)

Public Attributes

- const std::uint32_t thread_count_

  Number of threads in the worker pool.
- const bool suspend_

  Indicate if a thread without work goes to sleep instead of busy-waiting.
- std::atomic< std::uint32_t > counter_ = 0

  Counter used to give a unique id_ to the worker.
- std::vector< boost::intrusive_ptr< pooled_work_stealing > > schedulers_

  Keep track of each worker scheduler.
- boost::barrier barrier_

  Synchronize all the working thread after starting and before finishing.

12.58.1 Detailed Description

Shared storage among the working threads.

Definition at line 47 of file pooled_work_stealing.hpp.

12.58.2 Constructor & Destructor Documentation

12.58.2.1 pool_ctx()

```
trisycl::detail::pooled_work_stealing::pool_ctx::pool_ctx (
            std::uint32_t thread_count,
            bool suspend )  [inline]
```

Definition at line 48 of file pooled_work_stealing.hpp.

00051       , schedulers_ { thread_count, nullptr }
00052       , barrier_ { thread_count }
00053     {}
```

12.58.3 Member Data Documentation

12.58.3.1 barrier_

```
boost::barrier trisycl::detail::pooled_work_stealing::pool_ctx::barrier_
```

Synchronize all the working thread after starting and before finishing.

Definition at line 68 of file pooled_work_stealing.hpp.

12.58.3.2 counter_

```
std::atomic<std::uint32_t> trisycl::detail::pooled_work_stealing::pool_ctx::counter_ = 0
```

Counter used to give a unique id_ to the worker.

Definition at line 62 of file pooled_work_stealing.hpp.

12.58.3.3 schedulers_

```
std::vector<boost::intrusive_ptr<pooled_work_stealing> > trisycl::detail::pooled_work_↩
stealing::pool_ctx::schedulers_
```

Keep track of each worker scheduler.

Definition at line 65 of file pooled_work_stealing.hpp.

12.58.3.4 suspend_

```
const bool trisycl::detail::pooled_work_stealing::pool_ctx::suspend_
```

Indicate if a thread without work goes to sleep instead of busy-waiting.

Definition at line 59 of file pooled_work_stealing.hpp.

12.58.3.5 thread_count_

```
const std::uint32_t trisycl::detail::pooled_work_stealing::pool_ctx::thread_count_
```

Number of threads in the worker pool.

Definition at line 56 of file pooled_work_stealing.hpp.

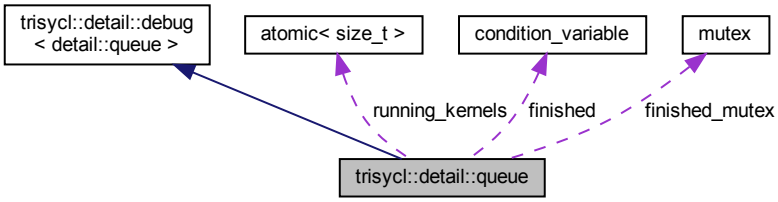
12.68 trisycl::detail::queue Struct Reference



Some implementation details about the SYCL queue.

```
#include <queue.hpp>
```

Inheritance diagram for trisycl::detail::queue:

Collaboration diagram for trisycl::detail::queue:

Public Member Functions

- queue ()

  Initialize the queue with 0 running kernel.
- void wait_for_kernel_execution ()

  Wait for all kernel completion.
- void kernel_start ()

  Signal that a new kernel started on this queue.
- void kernel_end ()

  Signal that a new kernel finished on this queue.
- virtual cl_command_queue get () const =0

  Return the underlying OpenCL command queue after doing a retain.
- virtual boost::compute::command_queue & get_boost_compute ()=0

  Return the underlying Boost.Compute command queue.
- virtual trisycl::context get_context () const =0

  Return the SYCL queue's context.
- virtual trisycl::device get_device () const =0

  Return the SYCL device the queue is associated with.
- virtual bool is_host () const =0

  Return whether the queue is executing on a SYCL host device.
- virtual ~queue ()

  Wait for all kernel completion before the queue destruction.

Public Attributes

- std::atomic< size_t > running_kernels

  Track the number of kernels still running to wait for their completion.
- std::condition_variable finished

  To signal when all the kernels have completed.
- std::mutex finished_mutex

  To protect the access to the condition variable.

Additional Inherited Members

12.68.1 Detailed Description

Some implementation details about the SYCL queue.

Definition at line 28 of file queue.hpp.

12.68.2 Constructor & Destructor Documentation

12.68.2.1 queue()

```
trisycl::detail::queue::queue ( )  [inline]
```

Initialize the queue with 0 running kernel.

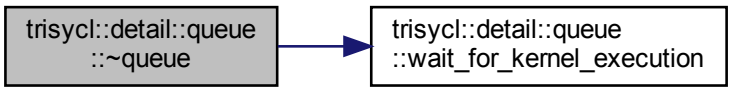
Definition at line 39 of file queue.hpp.

```
00039 :  running_kernels { 0 } {}
```

12.68.2.2 ~queue()

```
virtual trisycl::detail::queue::~queue ( )  [inline], [virtual]
```

Wait for all kernel completion before the queue destruction.



Todo Update according spec since queue destruction is non blocking

Definition at line 118 of file queue.hpp.

```
00118                   {
00119     wait_for_kernel_execution();
00120   }
```

References wait_for_kernel_execution().

Here is the call graph for this function:

12.68.3 Member Function Documentation

12.68.3.1 get()

```
virtual cl_command_queue trisycl::detail::queue::get ( ) const  [pure virtual]
```

Return the underlying OpenCL command queue after doing a retain.

This memory object is expected to be released by the developer.

Retain a reference to the returned cl_command_queue object.

Caller should release it when finished.

If the queue is a SYCL host queue then an exception is thrown.

Implemented in trisycl::detail::host_queue, and trisycl::detail::opencl_queue.

12.68.3.2 get_boost_compute()

```
virtual boost::compute::command_queue & trisycl::detail::queue::get_boost_compute ( )  [pure
virtual]
```

Return the underlying Boost.Compute command queue.

Implemented in trisycl::detail::host_queue, and trisycl::detail::opencl_queue.

12.68.3.3 get_context()

```
virtual trisycl::context trisycl::detail::queue::get_context ( ) const  [pure virtual]
```

Return the SYCL queue's context.

Report errors using SYCL exception classes.

Implemented in trisycl::detail::host_queue, and trisycl::detail::opencl_queue.

12.68.3.4 get_device()

```
virtual trisycl::device trisycl::detail::queue::get_device ( ) const  [pure virtual]
```

Return the SYCL device the queue is associated with.

Report errors using SYCL exception classes.

Implemented in trisycl::detail::host_queue, and trisycl::detail::opencl_queue.

12.68.3.5 is_host()

```
virtual bool trisycl::detail::queue::is_host ( ) const  [pure virtual]
```

Return whether the queue is executing on a SYCL host device.

Implemented in trisycl::detail::host_queue, and trisycl::detail::opencl_queue.

12.68.3.6 kernel_end()

```
void trisycl::detail::queue::kernel_end ( )  [inline]
```

Signal that a new kernel finished on this queue.

Definition at line 61 of file queue.hpp.

```
00061                    {
00062     TRISYCL_DUMP_T("A kernel of the queue ended");
00063     std::unique_lock<std::mutex> ul { finished_mutex };
00064     if (--running_kernels == 0) {
00065       // Micro-optimization:  unlock before the notification
00066       // https://en.cppreference.com/w/cpp/thread/condition_variable/notify_all
00067       ul.unlock();
00068       /* It was the last kernel running, so signal the queue just in
00069 case it was working for it for completion
00070
00071 In some cases several threads might want to wait for the
00072 same queue, because of this \c notify_one is not be enough
00073 and a \c notify_all is needed
00074 */
00075       finished.notify_all();
00076     }
00077   }
```

References finished, finished_mutex, running_kernels, and TRISYCL_DUMP_T.

12.68.3.7 kernel_start()

```
void trisycl::detail::queue::kernel_start ( )  [inline]
```

Signal that a new kernel started on this queue.

Definition at line 53 of file queue.hpp.

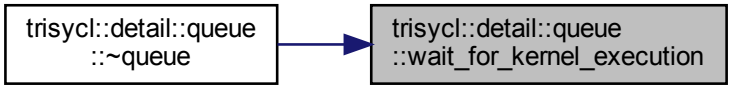
```
00053                      {
00054     TRISYCL_DUMP_T("A kernel has been added to the queue");
00055     // One more kernel
00056     ++running_kernels;
00057   }
```

References running_kernels, and TRISYCL_DUMP_T.

12.68.3.8 wait_for_kernel_execution()

```
void trisycl::detail::queue::wait_for_kernel_execution ( )  [inline]
```

Wait for all kernel completion.



Definition at line 42 of file queue.hpp.

```
00042                                  {
00043     TRISYCL_DUMP_T("Queue waiting for kernel completion");
00044     std::unique_lock<std::mutex> ul { finished_mutex };
00045     finished.wait(ul, [&] {
00046         // When there is no kernel running in this queue, we are ready to go
00047         return running_kernels == 0;
00048       });
00049   }
```

References finished, finished_mutex, running_kernels, and TRISYCL_DUMP_T.

Referenced by ~queue().

Receiving DMA.

```
#include <dma.hpp>
```

Inheritance diagram for trisycl::vendor::xilinx::acap::aie::receiving_dma< AXIStreamSwitch >:

Collaboration diagram for trisycl::vendor::xilinx::acap::aie::receiving_dma< AXIStreamSwitch >:

Public Member Functions

- receiving_dma (AXIStreamSwitch &axi_ss, ::trisycl::detail::fiber_pool &fe)

  Start the receiving DMA engine using an executor.
- void receive (std::span< axi_packet::value_type > sp)

  Enqueue a DMA transfer to receive a span.
- void write (const axi_packet &v) override

  The network sends some data to the DMA receiver input.
- bool try_write (const axi_packet &v) override

  The network try to send some data to the DMA receiver input.
- axi_packet::value_type read () override

  Waiting read by a tile program on a core input port from the switch.
- bool try_read (axi_packet::value_type &v) override

  Non-blocking read to a core input port.
- receiving_dma (AXIStreamSwitch &axi_ss, ::trisycl::detail::fiber_pool &fe)

  Start the receiving DMA engine using an executor.
- void receive (std::span< axi_packet::value_type > sp)

  Enqueue a DMA transfer to receive a span.
- void write (const axi_packet &v) override

  The network sends some data to the DMA receiver input.
- bool try_write (const axi_packet &v) override

  The network try to send some data to the DMA receiver input.
- axi_packet::value_type read () override

  Waiting read by a tile program on a core input port from the switch.
- bool try_read (axi_packet::value_type &v) override

  Non-blocking read to a core input port.

Private Types

- using dma_base = dma< AXIStreamSwitch, receiving_dma< AXIStreamSwitch > >
- using dma_base = dma< AXIStreamSwitch, receiving_dma< AXIStreamSwitch > >

Private Attributes

- boost::fibers::buffered_channel< axi_packet > fifo { 8 }
- AXIStreamSwitch & axi_ss

  Keep track of the AXI stream switch owning this port for debugging.

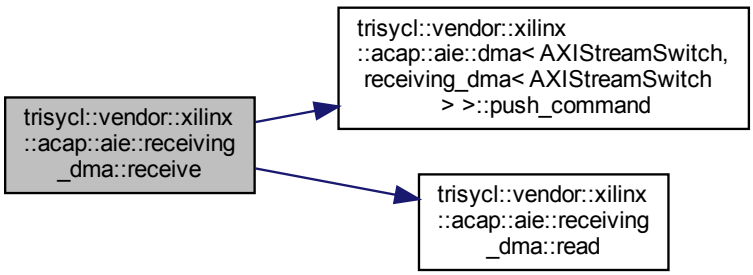
Enqueue a DMA transfer to receive a span.



Use std::span for 1D contiguous transfers only for now

Definition at line 227 of file dma.hpp.

```
00227                                                {
00228     this->push_command([=, this] {
00229       /* Write each element received from input router port into the
00230 memory described by DMA operation */
00231       for (auto& e :  sp) {
00232         e = read();
00233       }
00234     });
00235   }
```

References trisycl::vendor::xilinx::acap::aie::dma< AXIStreamSwitch, receiving_dma< AXIStreamSwitch > >::push_command(), and trisycl::vendor::xilinx::acap::aie::receiving_dma< AXIStreamSwitch >::read().

Here is the call graph for this function:

12.70.4.5 try_read() [1/2]

```
template<typename AXIStreamSwitch >
bool trisycl::vendor::xilinx::acap::aie::receiving_dma< AXIStreamSwitch >::try_read (
            axi_packet::value_type & v )  [inline], [override], [virtual]
```

Non-blocking read to a core input port.

Returns

true if the value was correctly read

Implements trisycl::vendor::xilinx::acap::aie::communicator_port.

Definition at line 259 of file dma.hpp.

```
00259                                                {
00260     axi_packet p;
00261
00262     if (fifo.try_pop(p) == boost::fibers::channel_op_status::success) {
00263       v = p.data;
00264       return true;
00265     }
00266     return false;
00267   }
```

References trisycl::vendor::xilinx::acap::aie::receiving_dma< AXIStreamSwitch >::fifo, and p.

12.70.4.6 try_read() [2/2]

```
template<typename AXIStreamSwitch >
bool trisycl::vendor::xilinx::acap::aie::receiving_dma< AXIStreamSwitch >::try_read (
            axi_packet::value_type & v )  [inline], [override], [virtual]
```

Non-blocking read to a core input port.

Returns

true if the value was correctly read

Implements trisycl::vendor::xilinx::acap::aie::communicator_port.

Definition at line 259 of file dma.hpp.

```
00259                                                {
00260     axi_packet p;
00261
00262     if (fifo.try_pop(p) == boost::fibers::channel_op_status::success) {
00263       v = p.data;
00264       return true;
00265     }
00266     return false;
00267   }
```

References trisycl::vendor::xilinx::acap::aie::receiving_dma< AXIStreamSwitch >::fifo, and p.

12.70.4.7 try_write() [1/2]

```
template<typename AXIStreamSwitch >
bool trisycl::vendor::xilinx::acap::aie::receiving_dma< AXIStreamSwitch >::try_write (
            const axi_packet & v )  [inline], [override], [virtual]
```

The network try to send some data to the DMA receiver input.

Returns

true if the packet is correctly enqueued or if the stream is closed, in order to to move on since we are in the tear-down phase of the infrastructure

Todo think about it again...

Implements trisycl::vendor::xilinx::acap::aie::communicator_port.

Definition at line 248 of file dma.hpp.

```
00248                                                {
00249     return this->fifo.try_push(v) != boost::fibers::channel_op_status::full;
00250   }
```

References trisycl::vendor::xilinx::acap::aie::receiving_dma< AXIStreamSwitch >::fifo.

12.70.4.8 try_write() [2/2]

```
template<typename AXIStreamSwitch >
bool trisycl::vendor::xilinx::acap::aie::receiving_dma< AXIStreamSwitch >::try_write (
            const axi_packet & v )  [inline], [override], [virtual]
```

The network try to send some data to the DMA receiver input.

Returns

true if the packet is correctly enqueued or if the stream is closed, in order to to move on since we are in the tear-down phase of the infrastructure

Todo think about it again...

Implements trisycl::vendor::xilinx::acap::aie::communicator_port.

Definition at line 248 of file dma.hpp.

```
00248                                           {
00249     return this->fifo.try_push(v) != boost::fibers::channel_op_status::full;
00250   }
```

References trisycl::vendor::xilinx::acap::aie::receiving_dma< AXIStreamSwitch >::fifo.

12.70.4.9 write() [1/2]

```
template<typename AXIStreamSwitch >
void trisycl::vendor::xilinx::acap::aie::receiving_dma< AXIStreamSwitch >::write (
            const axi_packet & v )  [inline], [override], [virtual]
```

The network sends some data to the DMA receiver input.

Implements trisycl::vendor::xilinx::acap::aie::communicator_port.

Definition at line 238 of file dma.hpp.

```
00238 { fifo.push(v); }
```

References trisycl::vendor::xilinx::acap::aie::receiving_dma< AXIStreamSwitch >::fifo.

12.70.4.10 write() [2/2]

```
template<typename AXIStreamSwitch >
void trisycl::vendor::xilinx::acap::aie::receiving_dma< AXIStreamSwitch >::write (
            const axi_packet & v )  [inline], [override], [virtual]
```

The network sends some data to the DMA receiver input.

Implements trisycl::vendor::xilinx::acap::aie::communicator_port.

Definition at line 238 of file dma.hpp.

```
00238 { fifo.push(v); }
```

References trisycl::vendor::xilinx::acap::aie::receiving_dma< AXIStreamSwitch >::fifo.

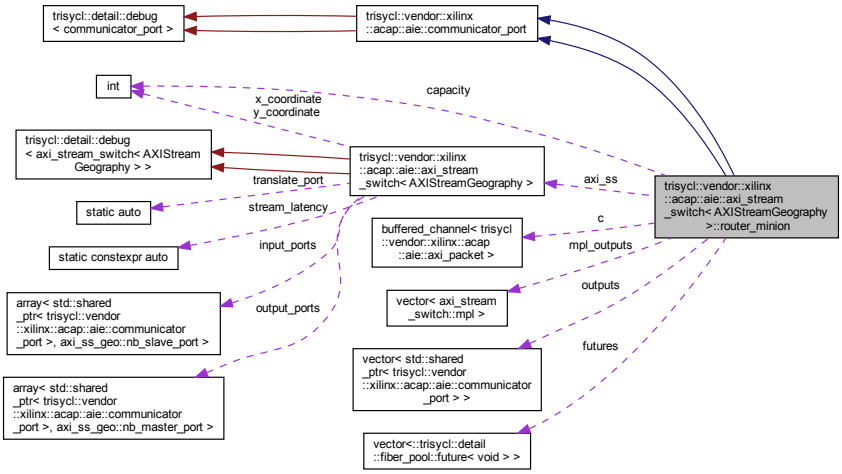
12.71 trisycl::vendor::xilinx::acap::aie::axi_stream_switch< AXIStreamGeography >::router_minion Class Reference



A router input port with routing skills.

```
#include <axi_stream_switch.hpp>
```

Inheritance diagram for trisycl::vendor::xilinx::acap::aie::axi_stream_switch< AXIStreamGeography >::router_minion:

Collaboration diagram for trisycl::vendor::xilinx::acap::aie::axi_stream_switch< AXIStreamGeography >::router_minion:

Public Types

- using value_type = axi_packet::value_type
- using value_type = axi_packet::value_type

Public Member Functions

- void join ()

  Wait for the fibers to complete.
- void write (const axi_packet &v) override

  Enqueue a packet on the router input.
- bool try_write (const axi_packet &v) override

  Try to enqueue a packet on the router input.
- value_type read () override

  Waiting read to a core input port.
- bool try_read (value_type &v) override

  Non-blocking read to a core input port.
- void connect_to (axi_stream_switch::mpl port_dest, std::shared_ptr< communicator_port > dest)

  Connect this routing input to a switch output.
- const auto & get_master_port_dests ()

  Return a vector of the master ports this router is forwarding.
- router_minion (axi_stream_switch &axi_ss, ::trisycl::detail::fiber_pool &fiber_executor, int capacity=axi_ss↩ _geo::latency)

  Create a router minion on this switch using a fiber executor.
- ∼router_minion () override

  Destructor handling the correct infrastructure shutdown.
- void join ()

  Wait for the fibers to complete.
- void write (const axi_packet &v) override

  Enqueue a packet on the router input.
- bool try_write (const axi_packet &v) override

  Try to enqueue a packet on the router input.
- value_type read () override

  Waiting read to a core input port.
- bool try_read (value_type &v) override

  Non-blocking read to a core input port.
- void connect_to (axi_stream_switch::mpl port_dest, std::shared_ptr< communicator_port > dest)

  Connect this routing input to a switch output.
- const auto & get_master_port_dests ()

  Return a vector of the master ports this router is forwarding.
- router_minion (axi_stream_switch &axi_ss, ::trisycl::detail::fiber_pool &fiber_executor, int capacity=axi_ss↩ _geo::latency)

  Create a router minion on this switch using a fiber executor.
- ∼router_minion () override

  Destructor handling the correct infrastructure shutdown.

Public Attributes

- const int capacity

  Router ingress capacity queue.
- boost::fibers::buffered_channel< axi_packet > c { static_cast<std::size_t>(capacity) }

  Ingress packet queue.
- std::vector< axi_stream_switch::mpl > mpl_outputs

  The ids of the outputs port the router minion has to forward to. Used by introspection to track current routing configuration.
- std::vector< std::shared_ptr< communicator_port > > outputs

The outputs the router minion has to forward to.

- std::vector<::trisycl::detail::fiber_pool::future< void > > futures

  To shepherd the routing fibers.

- axi_stream_switch & axi_ss

  Keep track of the AXI stream switch owning this port for debugging.

12.71.1 Detailed Description

template<typename AXIStreamGeography>
class trisycl::vendor::xilinx::acap::aie::axi_stream_switch< AXIStreamGeography >::router_minion

A router input port with routing skills.

Definition at line 61 of file axi_stream_switch.hpp.

12.71.2 Member Typedef Documentation

12.71.2.1 value_type [1/2]

```
template<typename AXIStreamGeography >
using trisycl::vendor::xilinx::acap::aie::axi_stream_switch< AXIStreamGeography >::router_↩
minion::value_type = axi_packet::value_type
```

Definition at line 95 of file axi_stream_switch.hpp.

12.71.2.2 value_type [2/2]

```
template<typename AXIStreamGeography >
using trisycl::vendor::xilinx::acap::aie::axi_stream_switch< AXIStreamGeography >::router_↩
minion::value_type = axi_packet::value_type
```

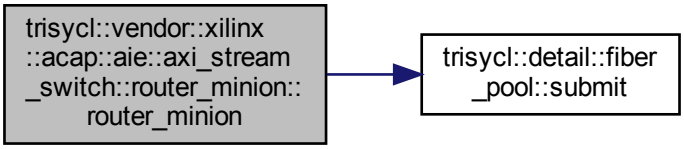
Definition at line 95 of file axi_stream_switch.hpp.

12.71.3 Constructor & Destructor Documentation

12.71.3.1 router_minion() [1/2]

```
template<typename AXIStreamGeography >
trisycl::vendor::xilinx::acap::aie::axi_stream_switch< AXIStreamGeography >::router_minion↩
::router_minion (
            axi_stream_switch & axi_ss,
            ::trisycl::detail::fiber_pool & fiber_executor,
            int capacity = axi_ss_geo::latency )  [inline]
```

Create a router minion on this switch using a fiber executor.



Use a fiber as a data mover from the input queue

Definition at line 166 of file axi_stream_switch.hpp.

```
00169       :  capacity { capacity }
00170       , axi_ss { axi_ss }
00171     {

12.71.5 Member Data Documentation

12.71.5.1 axi_ss

```
template<typename AXIStreamGeography >
axi_stream_switch & trisycl::vendor::xilinx::acap::aie::axi_stream_switch< AXIStreamGeography
>::router_minion::axi_ss
```

Keep track of the AXI stream switch owning this port for debugging.

Definition at line 83 of file axi_stream_switch.hpp.

Referenced by trisycl::vendor::xilinx::acap::aie::axi_stream_switch< AXIStreamGeography >::router_minion::connect_to(), trisycl::vendor::xilinx::acap::aie::axi_stream_switch< AXIStreamGeography >::router_minion::read(), trisycl::vendor::xilinx::acap::aie:: and trisycl::vendor::xilinx::acap::aie::axi_stream_switch< AXIStreamGeography >::router_minion::write().

12.71.5.2 c

```
template<typename AXIStreamGeography >
boost::fibers::buffered_channel< axi_packet > trisycl::vendor::xilinx::acap::aie::axi_stream_switch<
AXIStreamGeography >::router_minion::c { static_cast<std::size_t>(capacity) }
```

Ingress packet queue.

Definition at line 67 of file axi_stream_switch.hpp.

Referenced by trisycl::vendor::xilinx::acap::aie::axi_stream_switch< AXIStreamGeography >::router_minion::read(), trisycl::vendor::xilinx::acap::aie::axi_stream_switch< AXIStreamGeography >::router_minion::try_read(), trisycl::vendor::xilinx::acap:: and trisycl::vendor::xilinx::acap::aie::axi_stream_switch< AXIStreamGeography >::router_minion::write().

12.71.5.3 capacity

```
template<typename AXIStreamGeography >
const int trisycl::vendor::xilinx::acap::aie::axi_stream_switch< AXIStreamGeography >::router↩
_minion::capacity
```

Router ingress capacity queue.

Definition at line 64 of file axi_stream_switch.hpp.

12.71.5.4 futures

```
template<typename AXIStreamGeography >
std::vector<::trisycl::detail::fiber_pool::future< void > > trisycl::vendor::xilinx::acap::aie::axi_stream_s
AXIStreamGeography >::router_minion::futures
```

To shepherd the routing fibers.

Definition at line 80 of file axi_stream_switch.hpp.

Referenced by trisycl::vendor::xilinx::acap::aie::axi_stream_switch< AXIStreamGeography >::router_minion::join(), and trisycl::vendor::xilinx::acap::aie::axi_stream_switch< AXIStreamGeography >::router_minion::router_minion().

12.71.5.5 mpl_outputs

```
template<typename AXIStreamGeography >
std::vector< axi_stream_switch::mpl > trisycl::vendor::xilinx::acap::aie::axi_stream_switch<
AXIStreamGeography >::router_minion::mpl_outputs
```

The ids of the outputs port the router minion has to forward to. Used by introspection to track current routing configuration.

Definition at line 72 of file axi_stream_switch.hpp.

Referenced by trisycl::vendor::xilinx::acap::aie::axi_stream_switch< AXIStreamGeography >::router_minion::connect_to(), and trisycl::vendor::xilinx::acap::aie::axi_stream_switch< AXIStreamGeography >::router_minion::get_master_port_dests().

12.71.5.6 outputs

```
template<typename AXIStreamGeography >
std::vector< std::shared_ptr< communicator_port > > trisycl::vendor::xilinx::acap::aie::axi_stream_switch<
AXIStreamGeography >::router_minion::outputs
```

The outputs the router minion has to forward to.

This what is used to speed up the routing itself even if the id could be enough

Definition at line 77 of file axi_stream_switch.hpp.

Referenced by trisycl::vendor::xilinx::acap::aie::axi_stream_switch< AXIStreamGeography >::router_minion::connect_to().

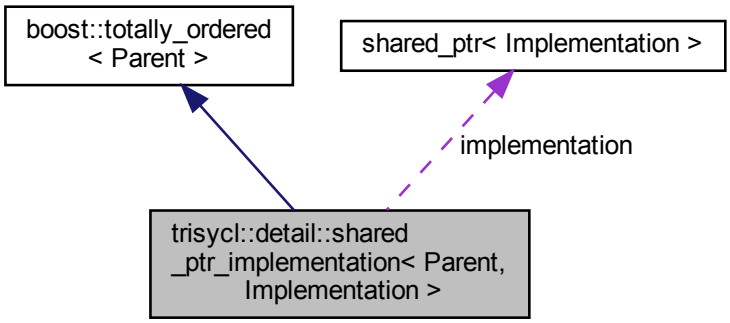
12.73 trisycl::detail::shared_ptr_implementation< Parent, Implementation > Struct Template Reference



Provide an implementation as shared_ptr with total ordering and hashing to be used with algorithms and in (un)ordered containers.

`#include <shared_ptr_implementation.hpp>`

Inheritance diagram for trisycl::detail::shared_ptr_implementation< Parent, Implementation >:

Collaboration diagram for trisycl::detail::shared_ptr_implementation< Parent, Implementation >:

Public Member Functions

- shared_ptr_implementation (std::shared_ptr< Implementation > i)

  The implementation directly as a shared pointer.
- shared_ptr_implementation (Implementation *i)

  The implementation takes the ownership from a raw pointer.
- shared_ptr_implementation ()=default

  Keep all other constructors to have usual shared_ptr behaviour.
- auto hash () const

  Forward the hashing for unordered containers to the implementation.

Public Attributes

- std::shared_ptr< Implementation > implementation

  The implementation forward everything to this... implementation.

Friends

- bool operator== (const Parent &lhs, const Parent &rhs)

  Equality operator.
- bool operator< (const Parent &lhs, const Parent &rhs)

  Inferior operator.

12.73.1 Detailed Description

template<typename Parent, typename Implementation>
struct trisycl::detail::shared_ptr_implementation< Parent, Implementation >

Provide an implementation as shared_ptr with total ordering and hashing to be used with algorithms and in (un)ordered containers.

To be used, a Parent class wanting an Implementation needs to inherit from.

The implementation ends up in a member really named "implementation".
`public detail::shared_ptr_implementation<Parent, Implementation>`

and also inject in std namespace a specialization for
`hash<Parent>`

Definition at line 38 of file shared_ptr_implementation.hpp.

12.73.2 Constructor & Destructor Documentation

12.73.2.1 shared_ptr_implementation() [1/3]

```
template<typename Parent , typename Implementation >
trisycl::detail::shared_ptr_implementation< Parent, Implementation >::shared_ptr_implementation
(
            std::shared_ptr< Implementation > i )  [inline]
```

The implementation directly as a shared pointer.

Definition at line 44 of file shared_ptr_implementation.hpp.
```
00045     : implementation { i } {}
```

12.73.2.2 shared_ptr_implementation() [2/3]

```
template<typename Parent , typename Implementation >
trisycl::detail::shared_ptr_implementation< Parent, Implementation >::shared_ptr_implementation
(
            Implementation * i )  [inline]
```

The implementation takes the ownership from a raw pointer.

Definition at line 49 of file shared_ptr_implementation.hpp.

```
00049 :  implementation { i } {}
```

12.73.2.3 shared_ptr_implementation() [3/3]

```
template<typename Parent , typename Implementation >
trisycl::detail::shared_ptr_implementation< Parent, Implementation >::shared_ptr_implementation
( )  [default]
```

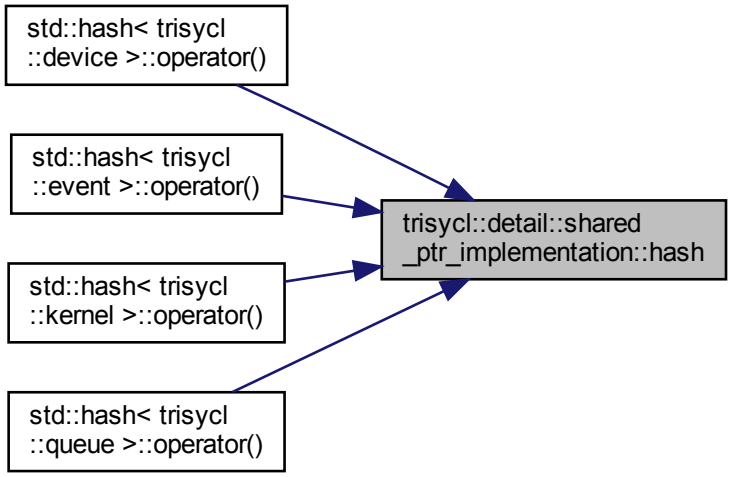
Keep all other constructors to have usual shared_ptr behaviour.

12.73.3 Member Function Documentation

12.73.3.1 hash()

```
template<typename Parent , typename Implementation >
auto trisycl::detail::shared_ptr_implementation< Parent, Implementation >::hash ( ) const
[inline]
```

Forward the hashing for unordered containers to the implementation.



Definition at line 87 of file shared_ptr_implementation.hpp.

```
00087                     {
00088     return std::hash<decltype(implementation)>{}(implementation);
00089   }
```

References trisycl::detail::shared_ptr_implementation< Parent, Implementation >::implementation.

Referenced by std::hash< trisycl::device >::operator()(), std::hash< trisycl::event >::operator()(), std::hash< trisycl::kernel >::operat
and std::hash< trisycl::queue >::operator()().

Here is the caller graph for this function:

12.73.4 Friends And Related Function Documentation

12.73.4.1 operator<

```
template<typename Parent , typename Implementation >
bool operator< (
             const Parent & lhs,
             const Parent & rhs )  [friend]
```

Inferior operator.

This is generalized by boost::less_than_comparable from boost::totally_ordered to implement the equality comparable concept

Use recipe for hidden friends from P1601R0: "Recommendations for Specifying “Hidden Friends”"

Todo Add this to the spec

Definition at line 81 of file shared_ptr_implementation.hpp.

```
00081                                                                    {
00082     return lhs.implementation < rhs.implementation;
00083   }
```

12.73.4.2 operator==

```
template<typename Parent , typename Implementation >
bool operator== (
             const Parent & lhs,
             const Parent & rhs )  [friend]
```

Equality operator.

This is generalized by boost::equality_comparable from boost::totally_ordered to implement the equality comparable concept

Use recipe for hidden friends from P1601R0: "Recommendations for Specifying “Hidden Friends""

Definition at line 65 of file shared_ptr_implementation.hpp.

```
00065                                                                    {
00066     return lhs.implementation == rhs.implementation;
00067   }
```

12.73.5 Member Data Documentation

12.73.5.1 implementation

```
template<typename Parent , typename Implementation >
std::shared_ptr<Implementation> trisycl::detail::shared_ptr_implementation< Parent, Implementation
>::implementation
```

The implementation forward everything to this... implementation.

Definition at line 41 of file shared_ptr_implementation.hpp.

Referenced by trisycl::detail::shared_ptr_implementation< Parent, Implementation >::hash(), trisycl::handler::parallel_for(), and trisycl::handler::single_task().

The documentation for this struct was generated from the following file:

east_1 , east_2 , east_3 , east_last = east_3 ,
shim_trace , size }

Layout of the AXI stream slave ports in the switch.

Static Public Attributes

- static auto constexpr latency = 4
- static auto constexpr fifo_depth = 16

  Depth of additional FIFO on specific FIFO paths.
- static constexpr auto nb_master_port

  Number of AXI stream master ports in the switch.
- static auto m_tile_ctrl_range

  A range of the master ports connected to the tile control inputs.
- static constexpr auto m_tile_ctrl_size

  Number of master ports connected to the tile control inputs.
- static auto m_fifo_range

  A range of the master ports connected to the FIFO inputs.
- static constexpr auto m_fifo_size

  Number of master ports connected to the FIFO inputs.
- static auto m_south_range

  A range of the South master ports.
- static constexpr auto m_south_size

  Number of South master ports.
- static auto m_west_range

  A range of the West master ports.
- static constexpr auto m_west_size

  Number of West master ports.
- static auto m_north_range

  A range of the North master ports.
- static constexpr auto m_north_size

  Number of North master ports.
- static auto m_east_range

  A range of the East master ports.
- static constexpr auto m_east_size

  Number of East master ports.
- static constexpr auto nb_slave_port

  Number of master AXI stream slave ports in the switch.
- static auto s_tile_ctrl_range

  A range of the slave ports connected to the tile control outputs.
- static constexpr auto s_tile_ctrl_size

  Number of slave ports connected to the tile control outputs.
- static auto s_fifo_range

  A range of the slave ports connected to the FIFO outputs.
- static constexpr auto s_fifo_size

  Number of slave ports connected to the FIFO outputs.
- static auto s_south_range

  A range of the South slave ports.
- static constexpr auto s_south_size

  Number of South slave ports.
- static auto s_west_range

  A range of the West slave ports.
- static constexpr auto s_west_size

Number of West slave ports.

- static auto s_north_range

  A range of the North slave ports.

- static constexpr auto s_north_size

  Number of North slave ports.

- static auto s_east_range

  A range of the East slave ports.

- static constexpr auto s_east_size

  Number of East slave ports.

Friends

- bool constexpr is_axi_master (master_port_layout)
- bool constexpr is_axi_master (slave_port_layout)

  Use a hidden friend to have introspection for slave_port_layout.

- bool constexpr is_axi_master (master_port_layout)
- bool constexpr is_axi_master (slave_port_layout)

  Use a hidden friend to have introspection for slave_port_layout.

12.75.3 Friends And Related Function Documentation

12.75.3.1 is_axi_master [1/4]

```
template<typename Layout >
bool constexpr is_axi_master (
             master_port_layout  )  [friend]
```

Todo Factorize out Use a hidden friend to have introspection for master_port_layout

Definition at line 679 of file geography.hpp.

```
00679                                                    {
00680       // Yes, master_port_layout is definitely an AXI master
00681       return true;
00682     }
```

12.75.3.2 is_axi_master [2/4]

```
template<typename Layout >
bool constexpr is_axi_master (
             master_port_layout  )  [friend]
```

Todo Factorize out Use a hidden friend to have introspection for master_port_layout

Definition at line 679 of file geography.hpp.

```
00679                                                    {
00680       // Yes, master_port_layout is definitely an AXI master
00681       return true;
00682     }
```

12.75.3.3 is_axi_master [3/4]

```
template<typename Layout >
bool constexpr is_axi_master (
             slave_port_layout  )  [friend]
```

Use a hidden friend to have introspection for slave_port_layout.

Definition at line 789 of file geography.hpp.

```
00789                                                    {
00790       // No, slave_port_layout is definitely not an AXI master
00791       return false;
00792     }
```

12.75.3.4 is_axi_master [4/4]

```
template<typename Layout >
bool constexpr is_axi_master (
             slave_port_layout  )  [friend]
```

Use a hidden friend to have introspection for slave_port_layout.

Definition at line 789 of file geography.hpp.

```
00789                                                          {
00790       // No, slave_port_layout is definitely not an AXI master
00791       return false;
00792     }
```

12.75.4 Member Data Documentation

12.75.4.1 fifo_depth

```
template<typename Layout >
static auto constexpr trisycl::vendor::xilinx::acap::aie::geography< Layout >::shim_axi_↩
stream_switch::fifo_depth = 16  [static], [constexpr]
```

Depth of additional FIFO on specific FIFO paths.

Definition at line 642 of file geography.hpp.

12.75.4.2 latency

```
template<typename Layout >
static auto constexpr trisycl::vendor::xilinx::acap::aie::geography< Layout >::shim_axi_↩
stream_switch::latency = 4  [static], [constexpr]
```

Todo factorize the 2 following values with core tiles? Default number of registers on default router paths

Todo factorize the 2 following values with core tiles? Default number of registers on default router paths

Definition at line 639 of file geography.hpp.

12.75.4.3 m_east_range

```
template<typename Layout >
static auto trisycl::vendor::xilinx::acap::aie::geography< Layout >::shim_axi_stream_switch↩
::m_east_range  [inline], [static]
```

Initial value:

```
=
      views::enum_type(master_port_layout::east_0,
                       master_port_layout::east_last)
```

A range of the East master ports.

Definition at line 745 of file geography.hpp.

12.75.4.4 m_east_size

```
template<typename Layout >
static constexpr auto trisycl::vendor::xilinx::acap::aie::geography< Layout >::shim_axi_↩
stream_switch::m_east_size  [static], [constexpr]
```

Initial value:

```
=
      detail::enum_count(master_port_layout::east_0,
                         master_port_layout::east_last)
```

Number of East master ports.

Definition at line 750 of file geography.hpp.

12.75.4.5 m_fifo_range

```
template<typename Layout >
static auto trisycl::vendor::xilinx::acap::aie::geography< Layout >::shim_axi_stream_switch↩
::m_fifo_range  [inline], [static]
```

Initial value:

```
=
      views::enum_type(master_port_layout::fifo_0,
                       master_port_layout::fifo_last)
```

A range of the master ports connected to the FIFO inputs.

Definition at line 705 of file geography.hpp.

12.75.4.6 m_fifo_size

```
template<typename Layout >
static constexpr auto trisycl::vendor::xilinx::acap::aie::geography< Layout >::shim_axi_↩
stream_switch::m_fifo_size  [static], [constexpr]
```

Initial value:

```
=
      detail::enum_count(master_port_layout::fifo_0,
                         master_port_layout::fifo_last)
```

Number of master ports connected to the FIFO inputs.

Definition at line 710 of file geography.hpp.

12.75.4.7 m_north_range

```
template<typename Layout >
static auto trisycl::vendor::xilinx::acap::aie::geography< Layout >::shim_axi_stream_switch↩
::m_north_range  [inline], [static]
```

Initial value:

```
=
      views::enum_type(master_port_layout::north_0,
                       master_port_layout::north_last)
```

A range of the North master ports.

Definition at line 735 of file geography.hpp.

12.75.4.8 m_north_size

```
template<typename Layout >
static constexpr auto trisycl::vendor::xilinx::acap::aie::geography< Layout >::shim_axi_↩
stream_switch::m_north_size  [static], [constexpr]
```

Initial value:

```
=
      detail::enum_count(master_port_layout::north_0,
                         master_port_layout::north_last)
```

Number of North master ports.

Definition at line 740 of file geography.hpp.

12.75.4.9 m_south_range

```
template<typename Layout >
static auto trisycl::vendor::xilinx::acap::aie::geography< Layout >::shim_axi_stream_switch↩
::m_south_range  [inline], [static]
```

Initial value:

```
=
      views::enum_type(master_port_layout::south_0,
                       master_port_layout::south_last)
```

A range of the South master ports.

Definition at line 715 of file geography.hpp.

12.75.4.10 m_south_size

```
template<typename Layout >
static constexpr auto trisycl::vendor::xilinx::acap::aie::geography< Layout >::shim_axi_↩
stream_switch::m_south_size  [static], [constexpr]
```

Initial value:

```
=
      detail::enum_count(master_port_layout::south_0,
                         master_port_layout::south_last)
```

Number of South master ports.

Definition at line 720 of file geography.hpp.

12.75.4.11 m_tile_ctrl_range

```
template<typename Layout >
static auto trisycl::vendor::xilinx::acap::aie::geography< Layout >::shim_axi_stream_switch↩
::m_tile_ctrl_range  [inline], [static]
```

Initial value:

```
=
      views::enum_type(master_port_layout::tile_ctrl,
                       master_port_layout::tile_ctrl_last)
```

A range of the master ports connected to the tile control inputs.

Todo Factorize out this range code with core tile

Todo Factorize out this range code with core tile

Definition at line 695 of file geography.hpp.

12.75.4.12 m_tile_ctrl_size

```
template<typename Layout >
static constexpr auto trisycl::vendor::xilinx::acap::aie::geography< Layout >::shim_axi_↩
stream_switch::m_tile_ctrl_size  [static], [constexpr]
```

Initial value:

```
=
      detail::enum_count(master_port_layout::tile_ctrl,
                         master_port_layout::tile_ctrl_last)
```

Number of master ports connected to the tile control inputs.

Definition at line 700 of file geography.hpp.

12.75.4.13 m_west_range

```
template<typename Layout >
static auto trisycl::vendor::xilinx::acap::aie::geography< Layout >::shim_axi_stream_switch↩
::m_west_range  [inline], [static]
```

Initial value:

```
=
      views::enum_type(master_port_layout::west_0,
                       master_port_layout::west_last)
```

A range of the West master ports.

Definition at line 725 of file geography.hpp.

12.75.4.14 m_west_size

```
template<typename Layout >
static constexpr auto trisycl::vendor::xilinx::acap::aie::geography< Layout >::shim_axi_↩
stream_switch::m_west_size  [static], [constexpr]
```

Initial value:

```
=
      detail::enum_count(master_port_layout::west_0,
                         master_port_layout::west_last)
```

Number of West master ports.

Definition at line 730 of file geography.hpp.

12.75.4.15 nb_master_port

```
template<typename Layout >
static constexpr auto trisycl::vendor::xilinx::acap::aie::geography< Layout >::shim_axi_↩
stream_switch::nb_master_port  [static], [constexpr]
```

Initial value:

```
=
      detail::underlying_value(master_port_layout::size)
```

Number of AXI stream master ports in the switch.

Todo factorize with a mix-in the following between master and slave

Todo factorize with a mix-in the following between master and slave

Definition at line 689 of file geography.hpp.

12.75.4.16 nb_slave_port

```
template<typename Layout >
static constexpr auto trisycl::vendor::xilinx::acap::aie::geography< Layout >::shim_axi_↩
stream_switch::nb_slave_port  [static], [constexpr]
```

Initial value:

```
=
      static_cast<int>(slave_port_layout::size)
```

Number of master AXI stream slave ports in the switch.

Definition at line 797 of file geography.hpp.

12.75.4.17 s_east_range

```
template<typename Layout >
static auto trisycl::vendor::xilinx::acap::aie::geography< Layout >::shim_axi_stream_switch↩

12.77 trisycl::detail::singleton< T > Struct Template Reference

Provide a singleton factory.

`#include <singleton.hpp>`

Static Public Member Functions

- static std::shared_ptr< T > instance ()

  Get a singleton instance of T.

12.77.1 Detailed Description

template<typename T>
struct trisycl::detail::singleton< T >

Provide a singleton factory.

Definition at line 23 of file singleton.hpp.

12.77.2 Member Function Documentation

12.77.2.1 instance()

```
template<typename T >
static std::shared_ptr< T > trisycl::detail::singleton< T >::instance ( )  [inline], [static]
```

Get a singleton instance of T.

Use a null_deleter since the singleton should not be deleted, as allocated in the static area

Definition at line 26 of file singleton.hpp.

```
00026                                    {
00027     // C++11 guaranties the static construction is thread-safe
00028     static T single;
00029 /** Use a null_deleter since the singleton should not be deleted,
00030 as allocated in the static area */
00031     static std::shared_ptr<T> sps { &single,
00032                                     boost::null_deleter {} };
00033
00034     return sps;
00035   }
```

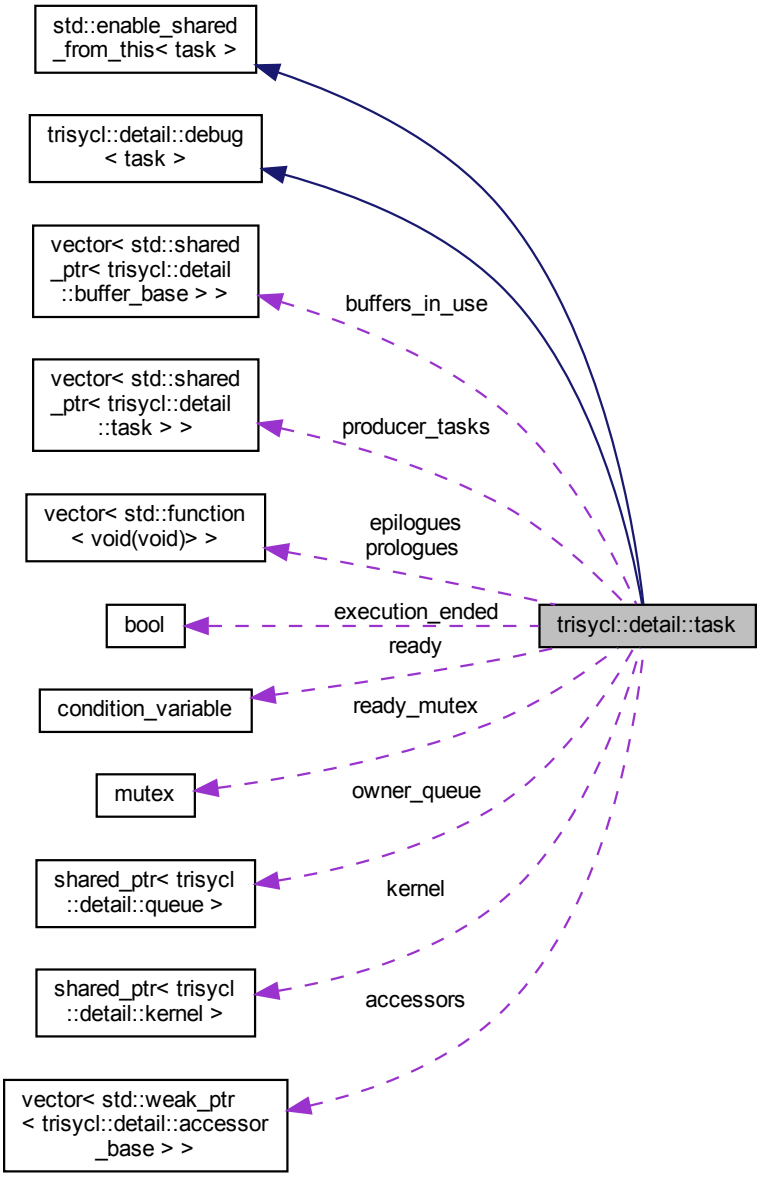
12.80 trisycl::detail::task Struct Reference



The abstraction to represent SYCL tasks executing inside command_group.

`#include <task.hpp>`

Inheritance diagram for trisycl::detail::task:

Collaboration diagram for trisycl::detail::task:

Public Member Functions

- task (const std::shared_ptr< detail::queue > &q)

  Create a task from a submitting queue.
- void schedule (std::function< void(void)> f)

  Add a new task to the task graph and schedule for execution.
- void wait_for_producers ()

  Wait for the required producer tasks to be ready.
- void release_buffers ()

  Release the buffers that have been used by this task.

- void notify_consumers ()

  Notify the waiting tasks that we are done.
- void wait ()

  Wait for this task to be ready.
- void add_buffer (std::shared_ptr< detail::buffer_base > &buf, bool is_write_mode)

  Register a buffer to this task.
- void prelude ()

  Execute the prologues.
- void postlude ()

  Execute the epilogues.
- void add_prelude (const std::function< void(void)> &f)

  Add a function to the prelude to run before kernel execution.
- void add_postlude (const std::function< void(void)> &f)

  Add a function to the postlude to run after kernel execution.
- auto get_queue ()

  Get the queue behind the task to run a kernel on.
- void set_kernel (const std::shared_ptr< trisycl::detail::kernel > &k)

  Set the OpenCL-compatible kernel running this task if any.
- trisycl::detail::kernel & get_kernel ()

  Get the kernel running if any.
- void set_arg (std::size_t arg_index, std::size_t arg_size, const void *scalar_value)

  Set a kernel argument by address.
- template<typename T >
  void set_arg (std::size_t arg_index, const T &scalar_value)

  Set a kernel argument by value.
- auto get_compute_buffer (std::size_t order)

  Get the Boost.Compute buffer for an accessor of the task.
- std::size_t register_accessor (std::weak_ptr< detail::accessor_base > a)

  Register an accessor and return its registration order.

Public Attributes

- std::vector< std::shared_ptr< detail::buffer_base > > buffers_in_use

  List of the buffers used by this task.
- std::vector< std::shared_ptr< detail::task > > producer_tasks

  The tasks producing the buffers used by this task.
- std::vector< std::function< void(void)> > prologues

  Keep track of any prologue to be executed before the kernel.
- std::vector< std::function< void(void)> > epilogues

  Keep track of any epilogue to be executed after the kernel.
- bool execution_ended = false

  Store if the execution ended, to be notified by task_ready.
- std::condition_variable ready

  To signal when this task is ready.
- std::mutex ready_mutex

  To protect the access to the condition variable.
- std::shared_ptr< detail::queue > owner_queue

  Keep track of the queue used to submission to notify kernel completion or to run OpenCL kernels on.
- std::shared_ptr< detail::kernel > kernel

  The OpenCL-compatible kernel run by this task, if any.
- std::vector< std::weak_ptr< detail::accessor_base > > accessors

  The accessors indexed by their creation order.

Additional Inherited Members

12.80.1 Detailed Description

The abstraction to represent SYCL tasks executing inside command_group.

"enable_shared_from_this" allows to access the shared_ptr behind the scene.

Definition at line 35 of file task.hpp.

12.80.2 Constructor & Destructor Documentation

12.80.2.1 task()

```
trisycl::detail::task::task (
            const std::shared_ptr< detail::queue > & q )  [inline]
```

Create a task from a submitting queue.

Definition at line 78 of file task.hpp.

```
00079     :  owner_queue { q } {}
```

12.80.3 Member Function Documentation

12.80.3.1 add_buffer()

```
void trisycl::detail::task::add_buffer (
            std::shared_ptr< detail::buffer_base > & buf,
            bool is_write_mode )  [inline]
```

Register a buffer to this task.

This is how the dependency graph is incrementally built.

Definition at line 176 of file task.hpp.

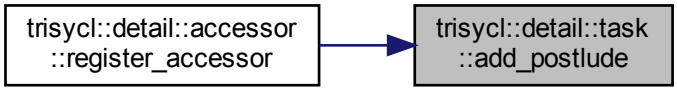
```
00177                                     {
00178     TRISYCL_DUMP_T("Add buffer " « buf « " in task " « this);
00179     /* Keep track of the use of the buffer to notify its release at
00180 the end of the execution */
00181     buffers_in_use.push_back(buf);
00182     // To be sure the buffer does not disappear before the kernel can run
00183     buf->use();
00184
00185     std::shared_ptr<detail::task> latest_producer;
00186     if (is_write_mode) {
00187       /* Set this task as the latest producer of the buffer so that
00188 another kernel may wait on this task */
00189       latest_producer = buf->set_latest_producer(shared_from_this());
00190     }
00191     else
00192       latest_producer = buf->get_latest_producer();
00193
00194     /* If the buffer is to be produced by a task, add the task in the
00195 producer list to wait on it before running the task core
00196
00197 If a buffer is accessed first in write mode and then in read mode,
00198 the task will add itself as a producer and will wait for itself
00199 when calling \c wait_for_producers, we avoid this by checking that
00200 \c latest_producer is not \c this
00201 */
00202     if (latest_producer && latest_producer != shared_from_this())
00203       producer_tasks.push_back(latest_producer);
00204   }
```

References buffers_in_use, producer_tasks, and TRISYCL_DUMP_T.

12.80.3.2 add_postlude()

```
void trisycl::detail::task::add_postlude (
            const std::function< void(void)> & f )  [inline]
```

Add a function to the postlude to run after kernel execution.



Definition at line 238 of file task.hpp.

```
00238                                                {
00239     epilogues.push_back(f);
00240   }
```

References epilogues.

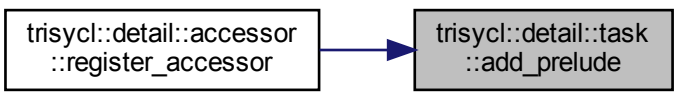
Referenced by trisycl::detail::accessor< T, Dimensions, Mode, Target >::register_accessor().

Here is the caller graph for this function:

12.80.3.3 add_prelude()

```
void trisycl::detail::task::add_prelude (
            const std::function< void(void)> & f )  [inline]
```

Add a function to the prelude to run before kernel execution.



Definition at line 230 of file task.hpp.

```
00230                                               {
00231     TRISYCL_DUMP_T("task::add_prelude");
00232
00233     prologues.push_back(f);
00234   }
```

References prologues, and TRISYCL_DUMP_T.

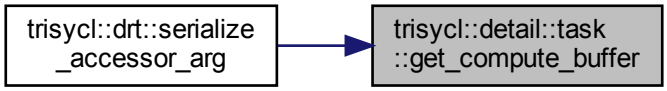
Referenced by trisycl::detail::accessor< T, Dimensions, Mode, Target >::register_accessor().

Here is the caller graph for this function:

12.80.3.4 get_compute_buffer()

```
auto trisycl::detail::task::get_compute_buffer (
             std::size_t order )  [inline]
```

Get the Boost.Compute buffer for an accessor of the task.



Definition at line 293 of file task.hpp.

```
00293                                          {
00294     return accessors[order].lock()->get_cl_buffer();
00295   }
```

References accessors.

Referenced by trisycl::drt::serialize_accessor_arg().

Here is the caller graph for this function:

12.80.3.5 get_kernel()

```
trisycl::detail::kernel & trisycl::detail::task::get_kernel ( )  [inline]
```

Get the kernel running if any.

Todo Specify this error in the spec

Definition at line 259 of file task.hpp.

```
00259                                       {
00260     if (!kernel)

00153       execution_ended = true;
00154     }
00155     /* \todo Verify that the memory model with the notify does not
00156 require some fence or atomic */
00157     ready.notify_all();
00158   }
```

References execution_ended, ready, ready_mutex, and TRISYCL_DUMP_T.

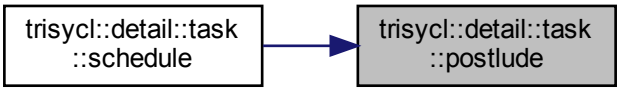
Referenced by schedule().

Here is the caller graph for this function:

12.80.3.8 postlude()

```
void trisycl::detail::task::postlude ( )  [inline]
```

Execute the epilogues.



Definition at line 220 of file task.hpp.

```
00220                 {
00221     for (const auto &p :  epilogues)
00222       p();
00223     /* Free the functors that may own an accessor owning a buffer
00224 preventing the command group to complete */
00225     epilogues.clear();
00226   }
```

References epilogues, and p.

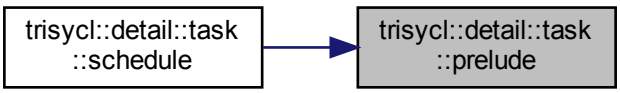
Referenced by schedule().

Here is the caller graph for this function:

12.80.3.9 prelude()

```
void trisycl::detail::task::prelude ( )  [inline]
```

Execute the prologues.



Definition at line 208 of file task.hpp.

```
00208                {
00209     TRISYCL_DUMP_T("task::prelude");
00210
00211     for (const auto &p :  prologues)
00212       p();
00213     /* Free the functors that may own an accessor owning a buffer
00214 preventing the command group to complete */
00215     prologues.clear();
00216   }
```

References p, prologues, and TRISYCL_DUMP_T.

Referenced by schedule().

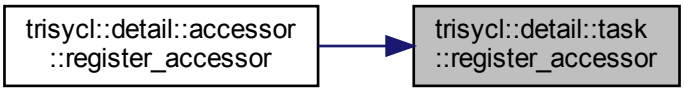
Here is the caller graph for this function:

12.80.3.10 register_accessor()

```
std::size_t trisycl::detail::task::register_accessor (
             std::weak_ptr< detail::accessor_base > a )  [inline]
```

Register an accessor and return its registration order.

I would prefer to name this method `register` but this is a C++ keyword...



Definition at line 304 of file task.hpp.

```
00304                                                    {
00305   accessors.push_back(a);
00306   return accessors.size() - 1;
00307 }
```

References a, and accessors.

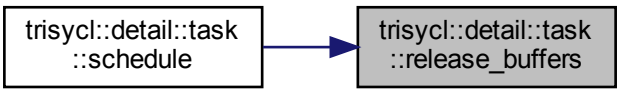
Referenced by trisycl::detail::accessor< T, Dimensions, Mode, Target >::register_accessor().

Here is the caller graph for this function:

12.80.3.11 release_buffers()

```
void trisycl::detail::task::release_buffers ( )  [inline]
```

Release the buffers that have been used by this task.



Definition at line 140 of file task.hpp.

```
00140                           {
00141     TRISYCL_DUMP_T("Task " « this « " releases the written buffers");
00142     for (auto b:  buffers_in_use)
00143       b->release();
00144     buffers_in_use.clear();
00145   }
```

References b, buffers_in_use, and TRISYCL_DUMP_T.

Referenced by schedule().

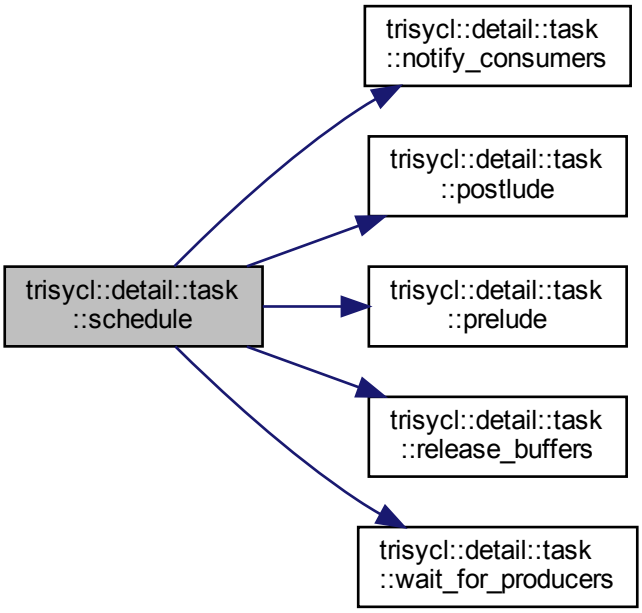
Here is the caller graph for this function:

12.80.3.12 schedule()

```
void trisycl::detail::task::schedule (
            std::function< void(void)> f )  [inline]
```

Add a new task to the task graph and schedule for execution.

Detach the thread since it will synchronize by its own means



Todo This is an issue if there is an exception in the kernel

Definition at line 83 of file task.hpp.

```
00083                                                {
00084     /* To keep a copy of the task shared_ptr after the end of the
00085 command group, capture it by copy in the following lambda.
00086 */

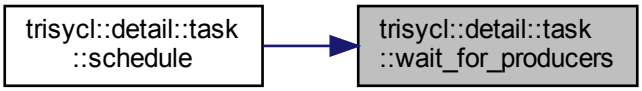
12.80.3.17 wait_for_producers()

```
void trisycl::detail::task::wait_for_producers ( )  [inline]
```

Wait for the required producer tasks to be ready.



Definition at line 130 of file task.hpp.

```
00130                                {
00131     TRISYCL_DUMP_T("Task " « this « " waits for the producer tasks");
00132     for (auto &t :  producer_tasks)
00133       t->wait();
00134     // We can let the producers rest in peace
00135     producer_tasks.clear();
00136   }
```

12.80.4 Member Data Documentation

12.80.4.1 accessors

```
std::vector<std::weak_ptr<detail::accessor_base> > trisycl::detail::task::accessors
```

The accessors indexed by their creation order.

This is used to relate a kernel parameter of a kernel generated by the device compiler to its accessor.

Definition at line 74 of file task.hpp.

Referenced by get_compute_buffer(), and register_accessor().

12.80.4.2 buffers_in_use

```
std::vector<std::shared_ptr<detail::buffer_base> > trisycl::detail::task::buffers_in_use
```

List of the buffers used by this task.

Todo Use a set to check that some buffers are not used many times at least on writing

Definition at line 43 of file task.hpp.

Referenced by add_buffer(), and release_buffers().

12.80.4.3 epilogues

```
std::vector<std::function<void(void)> > trisycl::detail::task::epilogues
```

Keep track of any epilogue to be executed after the kernel.

Definition at line 52 of file task.hpp.

Referenced by add_postlude(), and postlude().

12.80.4.4 execution_ended

```
bool trisycl::detail::task::execution_ended = false
```

Store if the execution ended, to be notified by task_ready.

Definition at line 55 of file task.hpp.

Referenced by notify_consumers(), and wait().

12.80.4.5 kernel

```
std::shared_ptr<detail::kernel> trisycl::detail::task::kernel
```

The OpenCL-compatible kernel run by this task, if any.

Definition at line 68 of file task.hpp.

Referenced by get_kernel().

12.80.4.6 owner_queue

```
std::shared_ptr<detail::queue> trisycl::detail::task::owner_queue
```

Keep track of the queue used to submission to notify kernel completion or to run OpenCL kernels on.

Definition at line 65 of file task.hpp.

Referenced by get_queue(), and schedule().

12.80.4.7 producer_tasks

```
std::vector<std::shared_ptr<detail::task> > trisycl::detail::task::producer_tasks
```

The tasks producing the buffers used by this task.

Definition at line 46 of file task.hpp.

Referenced by add_buffer(), and wait_for_producers().

12.80.4.8 prologues

```
std::vector<std::function<void(void)> > trisycl::detail::task::prologues
```

Keep track of any prologue to be executed before the kernel.

Definition at line 49 of file task.hpp.

Referenced by add_prelude(), and prelude().

12.80.4.9 ready

```
std::condition_variable trisycl::detail::task::ready
```

To signal when this task is ready.

Definition at line 58 of file task.hpp.

Referenced by notify_consumers(), and wait().

12.80.4.10 ready_mutex

```
std::mutex trisycl::detail::task::ready_mutex
```

To protect the access to the condition variable.

Definition at line 61 of file task.hpp.

Referenced by notify_consumers(), and wait().

12.82 trisycl::mixin::accessor< T, Dimensions >::track_index< N > Struct Template Reference

Proxy object to transform an expression like accessor[i1][i2][i3] into the implementation mdpsan(i1,i2,i3) one index at a time.

```
#include <accessor.hpp>
```

Collaboration diagram for trisycl::mixin::accessor< T, Dimensions >::track_index< N >:

Public Member Functions

- track_index (accessor &a)

  Construct the initial tracking object from the accessor.
- template<typename... Index>
  track_index (mdspan &m, Index &&... inds)

  Create a tracking object from an mdspan and a list of indices.
- decltype(auto) operator[ ] (std::size_t index)

  The individual indexing operator.

Public Attributes

- mdspan & mds

  Keep a reference to the mdspan to eventually resolve the indexing.
- std::array< std::size_t, N > indices

  The list of indices in the order of [i1][i2][i3]...

12.82.1 Detailed Description

template<typename T, int Dimensions>
template<std::size_t N>
struct trisycl::mixin::accessor< T, Dimensions >::track_index< N >

Proxy object to transform an expression like accessor[i1][i2][i3] into the implementation mdpsan(i1,i2,i3) one index at a time.

It gathers intermediate [index] to finally call the mdspan indexing operator once they are all available

\parameter[in] N is the number of indices which can be stored in this proxy

Definition at line 174 of file accessor.hpp.

12.82.2 Constructor & Destructor Documentation

12.82.2.1 track_index() [1/2]

```
template<typename T , int Dimensions>
template<std::size_t N>
trisycl::mixin::accessor< T, Dimensions >::track_index< N >::track_index (
            accessor & a )  [inline]
```

Construct the initial tracking object from the accessor.

Definition at line 183 of file accessor.hpp.

```
00184         :  mds { a.access } {}
```

12.82.2.2 track_index() [2/2]

```
template<typename T , int Dimensions>
template<std::size_t N>
template<typename...  Index>
trisycl::mixin::accessor< T, Dimensions >::track_index< N >::track_index (
             mdspan & m,
             Index &&...  inds )  [inline]
```

Create a tracking object from an mdspan and a list of indices.

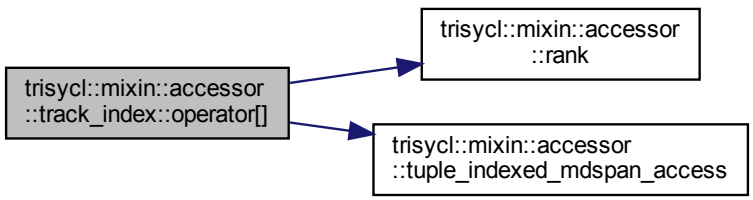
Definition at line 188 of file accessor.hpp.

```
00189         :  mds { m }
00190         // Typically there will be N - 1 indices in the array of size N
00191         , indices { std::forward<Index>(inds)...  } {}
```

12.82.3 Member Function Documentation

12.82.3.1 operator[]()

```
template<typename T , int Dimensions>
template<std::size_t N>
decltype(auto) trisycl::mixin::accessor< T, Dimensions >::track_index< N >::operator[] (
             std::size_t index )  [inline]
```



The individual indexing operator.

Definition at line 194 of file accessor.hpp.

```
00194                                                {
00195       // Keep track of the new index in the last element
00196       indices[N - 1] = index;
00197       if constexpr (N == accessor::rank())
00198         // If we have accumulated all the indices, call the mdspan
00199         // indexing function
00200         return tuple_indexed_mdspan_access(mds, indices);
00201       else
00202         // Otherwise return a tracker from the current indices and
00203         // with 1 more room for the next index
00204         return std::make_from_tuple<track_index<N + 1>>(
00205             std::tuple_cat(std::forward_as_tuple(mds), indices));
00206     }
```

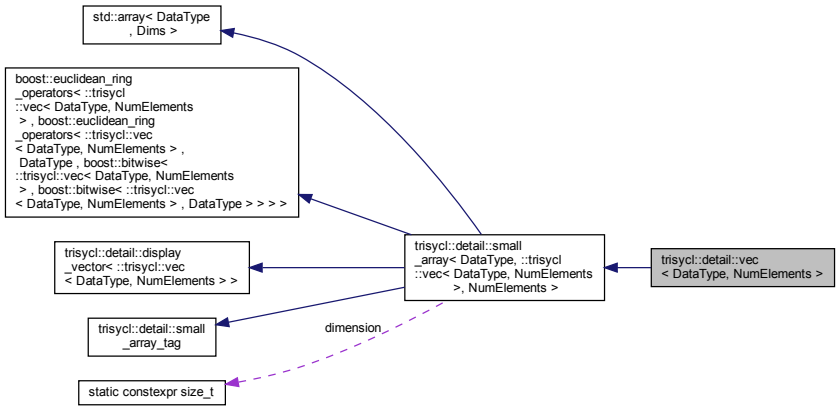
12.88 trisycl::detail::vec< DataType, NumElements > Class Template Reference



forward declaration to use in the detail class

`#include <vec.hpp>`

Inheritance diagram for trisycl::detail::vec< DataType, NumElements >:

Collaboration diagram for trisycl::detail::vec< DataType, NumElements >:

Public Member Functions

- template<typename... Types>
  requires (sizeof...(Types) != NumElements)
  vec (const Types... args)

  Construct a vec from anything from a scalar (to initialize all the elements with this value) up to an aggregate of scalar and vector types (in this case the total number of elements must match the size of the vector).
- vec ()=default

  Use classical constructors too.
- auto get_count () const

  Return the number of elements in the vector.
- auto get_size () const

  Return the number of bytes.
- template<typename convertT , rounding_mode roundingMode>
  vec< convertT, NumElements > convert () const

- template<typename asT >
  asT as () const
- template<int... swizzleIndexs>
  __swizzled_vec__< DataType, sizeof...(swizzleIndexs)> swizzle () const
- template<typename F >
  auto map (F f) const
- template<typename T , int size, typename F >
  auto zip (::trisycl::vec< T, size > x, F f) const
- template<typename T , int size, typename F >
  auto zip (::trisycl::vec< T, size > y, ::trisycl::vec< T, size > z, F f) const

Protected Member Functions

- template<typename... Ts>
  __swizzled_base_vec__< DataType, sizeof...(Ts)> swizzle (Ts... swizzleIndexes) const

  Apply a swizzle operation from swizzleIndexes parameters.

Private Types

- using basic_type = typename detail::small_array< DataType, ::trisycl::vec< DataType, NumElements >, NumElements >

Static Private Member Functions

- template<typename V , typename Element , int s>
  static auto flatten (const vec< Element, s > i)

  Flattening helper that does not change scalar values but flatten a vec<T, n> v into a tuple<T, T,..., T>{ v[0], v[1],..., v[n-1] }.
- template<typename V , typename Element , int s>
  static auto flatten (const ::trisycl::vec< Element, s > i)
- template<typename V , typename Type >
  static auto flatten (const Type i)

  If we do not have a vector, just forward it as a tuple up to the final initialization.
- template<typename V , typename... Types>
  static auto flatten_to_tuple (const Types... i)

  Take some initializer values and apply flattening on each value.
- template<typename T , typename F , std::size_t... Is>
  static auto apply_unary_functor_impl (T tuple, F f, std::index_sequence< Is... >)
- template<typename T , typename F >
  static auto apply_unary_functor (const T x, F f)
- template<typename T , typename T2 , typename F , std::size_t... Is>
  static auto apply_binary_functor_impl (T xTuple, T2 yTuple, F f, std::index_sequence< Is... >)
- template<typename T , typename T2 , typename T3 , typename F , std::size_t... Is>
  static auto apply_ternary_functor_impl (T xTuple, T2 yTuple, T3 zTuple, F f, std::index_sequence< Is... >)
- template<typename T , typename T2 , typename F >

12.88.1 Detailed Description

template<typename DataType, int NumElements>
class trisycl::detail::vec< DataType, NumElements >

forward declaration to use in the detail class

Small SYCL vector class.

Definition at line 41 of file vec.hpp.

12.88.2 Member Typedef Documentation

12.88.2.1 basic_type

```
template<typename DataType , int NumElements>
using trisycl::detail::vec< DataType, NumElements >::basic_type = typename detail::small_array<Data↩
Type, ::trisycl::vec<DataType, NumElements>, NumElements>  [private]
```

Definition at line 45 of file vec.hpp.

12.88.3 Constructor & Destructor Documentation

12.88.3.1 vec() [1/2]

```
template<typename DataType , int NumElements>
template<typename...  Types>
requires (sizeof...(Types) != NumElements)
trisycl::detail::vec< DataType, NumElements >::vec (
            const Types...  args )  [inline]
```

Construct a vec from anything from a scalar (to initialize all the elements with this value) up to an aggregate of scalar and vector types (in this case the total number of elements must match the size of the vector).

Do not use this constructor with NumElements to avoid ambiguity with the inherited small_array constructor.

Definition at line 61 of file vec.hpp.

```
00062       :  basic_type { detail::expand<vec>(flatten_to_tuple<vec>(args...))  } {}
```

12.88.3.2 vec() [2/2]

```
template<typename DataType , int NumElements>
trisycl::detail::vec< DataType, NumElements >::vec ( )  [default]
```

Use classical constructors too.

00197     }
00198     return result;
00199   };
```

References trisycl::detail::vec< DataType, NumElements >::get_count(), and n.

Here is the call graph for this function:

12.88.4.8 flatten() [1/3]

```
template<typename DataType , int NumElements>
template<typename V , typename Element , int s>
static auto trisycl::detail::vec< DataType, NumElements >::flatten (
             const ::trisycl::vec< Element, s > i )  [inline], [static], [private]
```

Definition at line 88 of file vec.hpp.

```
00088                                                {
00089     static_assert(s <= V::dimension,
00090                   "The element i will not fit in the vector");
00091     return static_cast<std::array<Element, s>>(i);
00092   }
```

References i.

12.88.4.9 flatten() [2/3]

```
template<typename DataType , int NumElements>
template<typename V , typename Type >
static auto trisycl::detail::vec< DataType, NumElements >::flatten (
             const Type i )  [inline], [static], [private]
```

If we do not have a vector, just forward it as a tuple up to the final initialization.

Returns

typically tuple<double>{ 2.4 } from 2.4 input for example

Definition at line 101 of file vec.hpp.

```
00101                                {
00102     return std::make_tuple(i);
00103   }
```

References i.

12.88.4.10 flatten() [3/3]

```
template<typename DataType , int NumElements>
template<typename V , typename Element , int s>
static auto trisycl::detail::vec< DataType, NumElements >::flatten (
            const vec< Element, s > i )  [inline], [static], [private]
```

Flattening helper that does not change scalar values but flatten a vec<T, n> v into a tuple<T, T,..., T>{ v[0], v[1],..., v[n-1] }.

If we have a vector, just forward its array content since an array has also a tuple interface :-) (23.3.2.9 Tuple interface to class template array [array.tuple])

Definition at line 81 of file vec.hpp.

```
00081                                          {
00082     static_assert(s <= V::dimension,
00083                   "The element i will not fit in the vector");
00084     return static_cast<std::array<Element, s>>(i);
00085   }
```

References i.

12.88.4.11 flatten_to_tuple()

```
template<typename DataType , int NumElements>
template<typename V , typename...  Types>
static auto trisycl::detail::vec< DataType, NumElements >::flatten_to_tuple (
            const Types...  i )  [inline], [static], [private]
```

Take some initializer values and apply flattening on each value.

Returns

a tuple of scalar initializer values

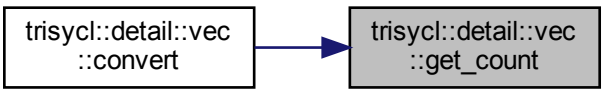
Definition at line 111 of file vec.hpp.

```
00111                                                {
00112     // Concatenate the tuples returned by each flattening
00113     return std::tuple_cat(flatten<V>(i)...);
00114   }
```

References i.

12.88.4.12 get_count()

```
template<typename DataType , int NumElements>
auto trisycl::detail::vec< DataType, NumElements >::get_count ( ) const  [inline]
```



Return the number of elements in the vector.

Definition at line 177 of file vec.hpp.

```
00177                          {
00178     return NumElements;
00179   }
```

12.90 trisycl::vendor::trisycl::random::xorshift< Nbits > Struct Template Reference

A possible implementation of the xorshift RNGs from.

`#include <xorshift.hpp>`

Collaboration diagram for trisycl::vendor::trisycl::random::xorshift< Nbits >:

Public Types

- using value_type = std::remove_const_t< decltype(initial_state)>

  The type of the internal state of the generator.
- using result_type = value_type

  The type of the result.
- using value_type = std::remove_const_t< decltype(initial_state)>

  The type of the internal state of the generator.
- using result_type = value_type

  The type of the result.

Public Member Functions

- xorshift (const value_type &s)

  Initialize the internal state from a user-given value.
- xorshift ()=default
- const result_type & operator() ()

  Compute a new pseudo random integer.
- xorshift (const value_type &s)

  Initialize the internal state from a user-given value.
- xorshift ()=default
- const result_type & operator() ()

  Compute a new pseudo random integer.

Static Public Member Functions

- static auto constexpr min ()

  The minimum returned value.
- static auto constexpr max ()

  The maximum returned value.
- static auto constexpr min ()

  The minimum returned value.
- static auto constexpr max ()

  The maximum returned value.

Public Attributes

- value_type state = initial_state

  The internal state of the pseudo random generator.

Static Public Attributes

- static auto constexpr bit_size = Nbits

  Bit size of the random generator data type.
- static auto constexpr initial_state

  The default initial internal state of the pseudo random generator.

12.90.1 Detailed Description

template<int Nbits = 32>
struct trisycl::vendor::trisycl::random::xorshift< Nbits >

A possible implementation of the xorshift RNGs from.

Marsaglia, George (July 2003). "Xorshift RNGs". Journal of Statistical Software. 8 (14). doi:10.18637/jss.v008.i14

Panneton, François; L'Écuyer, Pierre (October 2005). "On the xorshift random number generators" (PDF). ACM Transactions on Modeling and Computer Simulation. 15 (4):346–361. doi:10.1145/1113316.1113319

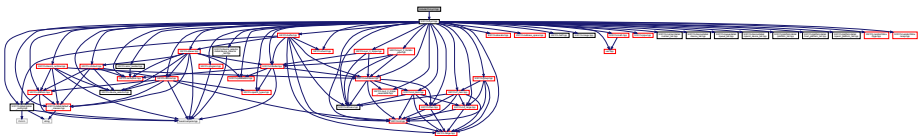
Chapter 13



File Documentation

13.1 include/CL/sycl.hpp File Reference

This is the main SYCL 1.2.1 interoperability header to expose triSYCL into the `cl::sycl` namespace.

```
#include "triSYCL/sycl.hpp"
```

Include dependency graph for sycl.hpp:

Namespaces

- namespace cl
- namespace cl::sycl

  The official SYCL 1.2.1 specification exposes the API in the cl::sycl namespace.

Macros

- #define TRISYCL_SYCL_NAMESPACE cl::sycl

  Define what is the real SYCL namespace to use.

13.1.1 Detailed Description

This is the main SYCL 1.2.1 interoperability header to expose triSYCL into the `cl::sycl` namespace.

Definition in file sycl.hpp.

13.1.2 Macro Definition Documentation

13.1.2.1 TRISYCL_SYCL_NAMESPACE

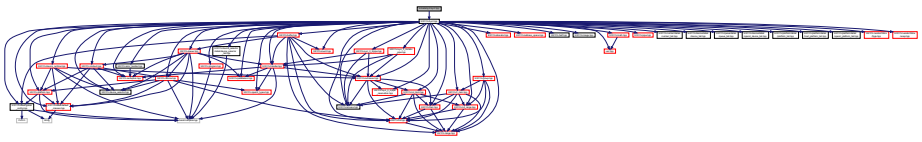
```
#define TRISYCL_SYCL_NAMESPACE cl::sycl
```

Define what is the real SYCL namespace to use.

Definition at line 11 of file sycl.hpp.

13.2 sycl.hpp

Go to the documentation of this file.



```
00001 #ifndef TRISYCL_CL_SYCL_HPP
00002 #define TRISYCL_CL_SYCL_HPP
00003

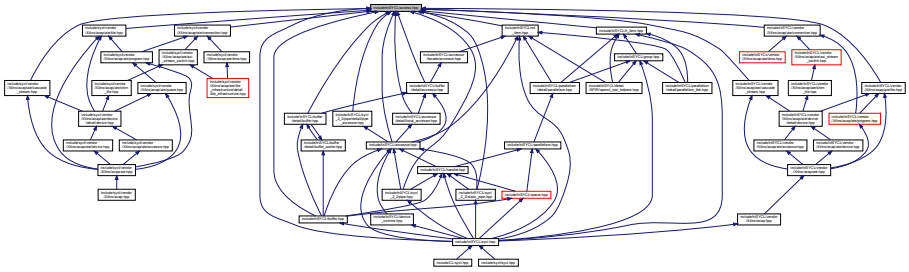
13.6 sycl.hpp



Go to the documentation of this file.

```
00001 #ifndef TRISYCL_TRISYCL_HPP
00002 #define TRISYCL_TRISYCL_HPP
00003
00004 /** \file
00005
00006 \mainpage
00007
00008 This is the main triSYCL C++ header file to experiment with the
00009 SYCL specification.
00010
00011 It declares everything into the \c ::trisycl namespace instead of
00012 \c ::sycl for SYCL 2020 or \c ::cl::sycl for SYCL 1.2.1 to express
00013 triSYCL specific extensions and to be used in full or partially
00014 with other SYCL implementations without naming conflict.
00015
00016 You can use sycl/sycl.hpp or CL/sycl.hpp headers instead to use
00017 this implementation with the usual \c ::sycl or \c ::cl::sycl
00018 namespaces.
00019
00020 For more information about SYCL:
00021 http://www.khronos.org/sycl/
00022
00023 For more information on this project and to access to the source of
00024 this file, look at https://github.com/triSYCL/triSYCL
00025
00026 The Doxygen version of the implementation itself is in
00027 http://trisycl.github.io/triSYCL/Doxygen/triSYCL/html and
00028 http://trisycl.github.io/triSYCL/Doxygen/triSYCL/triSYCL-implementation-refman.pdf

13.7 include/triSYCL/access.hpp File Reference

This graph shows which files directly or indirectly include this file:

Namespaces

- namespace trisycl

  The vector type to be used as SYCL vector.
- namespace trisycl::access

  Describe the type of access by kernels.

Enumerations

- enum class trisycl::access::mode {
  trisycl::access::read = 42 , trisycl::access::write , trisycl::access::read_write , trisycl::access::discard_write ,
  trisycl::access::discard_read_write , trisycl::access::atomic }

  This describes the type of the access mode to be used via accessor.
- enum class trisycl::access::target {
  trisycl::access::global_buffer = 2014 , trisycl::access::constant_buffer , trisycl::access::local , trisycl::access::image
  ,
  trisycl::access::host_buffer , trisycl::access::host_image , trisycl::access::image_array , trisycl::access::pipe ,
  trisycl::access::blocking_pipe }

  The target enumeration describes the type of object to be accessed via the accessor.
- enum class trisycl::access::fence_space : char { trisycl::access::local_space , trisycl::access::global_space ,
  trisycl::access::global_and_local }

  Precise the address space a barrier needs to act on.

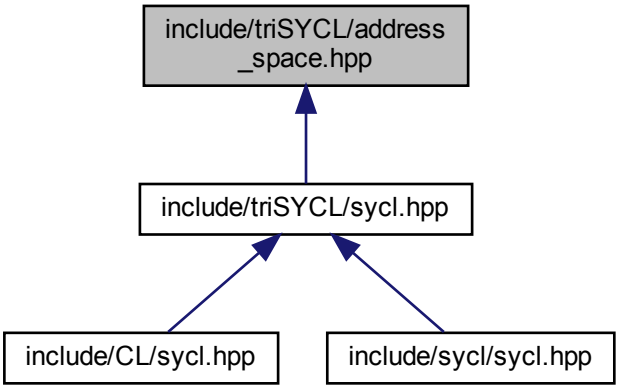
13.13 include/triSYCL/address_space.hpp File Reference



Implement OpenCL address spaces in SYCL with C++-style.

```
#include "triSYCL/address_space/detail/address_space.hpp"
```

Include dependency graph for address_space.hpp:

This graph shows which files directly or indirectly include this file:

Namespaces

- namespace trisycl

  The vector type to be used as SYCL vector.
- namespace trisycl::access

  Describe the type of access by kernels.

Typedefs

- template<typename T >
  using trisycl::constant = detail::addr_space< T, access::address_space::constant_space >

  Declare a variable to be in the OpenCL constant address space.
- template<typename T >
  using trisycl::constant_ptr = constant< T * >

  Declare a variable to be in the OpenCL constant address space.
- template<typename T >
  using trisycl::generic = detail::addr_space< T, access::address_space::generic_space >

  Declare a variable to be in the OpenCL 2 generic address space.
- template<typename T >
  using trisycl::global = detail::addr_space< T, access::address_space::global_space >

  Declare a variable to be in the OpenCL global address space.
- template<typename T >
  using trisycl::global_ptr = global< T * >

  Declare a variable to be in the OpenCL global address space.
- template<typename T >
  using trisycl::local = detail::addr_space< T, access::address_space::local_space >

  Declare a variable to be in the OpenCL local address space.
- template<typename T >
  using trisycl::local_ptr = local< T * >

  Declare a variable to be in the OpenCL local address space.
- template<typename T >
  using trisycl::priv = detail::addr_space< T, access::address_space::private_space >

  Declare a variable to be in the OpenCL private address space.
- template<typename T >
  using trisycl::private_ptr = priv< T * >

  Declare a variable to be in the OpenCL private address space.
- template<typename Pointer , access::address_space AS>
  using trisycl::multi_ptr = detail::address_space_ptr< Pointer, AS >

  A pointer that can be statically associated to any address-space.

Enumerations

- enum class trisycl::access::address_space {
  trisycl::access::global_space , trisycl::access::local_space , trisycl::access::constant_space , trisycl::access::private_space
  ,
  trisycl::access::generic_space }

  Enumerate the different OpenCL 2 address spaces.

Functions

- template<typename T , access::address_space AS>
  multi_ptr< T, AS > trisycl::make_ptr (multi_ptr< T, AS > pointer)

  Construct a trisycl::multi_ptr<> with the right type.
- template<typename T , access::address_space AS>
  multi_ptr< T, AS > trisycl::make_ptr (T *pointer)

  Construct a trisycl::multi_ptr<> with the right type.

13.13.1 Detailed Description

Implement OpenCL address spaces in SYCL with C++-style.

Note that in SYCL 1.2, only pointer types should be specified but in this implementation we generalize the concept to any type.

Todo Add the alias ..._ptr<T> = ...<T *>

13.15 include/triSYCL/address_space/detail/address_space.hpp File Reference

Implement OpenCL address spaces in SYCL with C++-style.

This graph shows which files directly or indirectly include this file:

Classes

- struct trisycl::detail::ocl_type< T, AS >

Generate a type with some real OpenCL 2 attribute if we are on an OpenCL device. More...

- struct trisycl::detail::ocl_type< T, access::address_space::constant_space >

  Add an attribute for __constant address space. More...
- struct trisycl::detail::ocl_type< T, access::address_space::global_space >

  Add an attribute for __global address space. More...
- struct trisycl::detail::ocl_type< T, access::address_space::local_space >

  Add an attribute for __local address space. More...
- struct trisycl::detail::ocl_type< T, access::address_space::private_space >

  Add an attribute for __private address space. More...
- struct trisycl::detail::address_space_base< T, AS >

  Implementation of the base infrastructure to wrap something in an OpenCL address space. More...
- struct trisycl::detail::address_space_variable< T, AS >

  Implementation of a variable with an OpenCL address space. More...
- struct trisycl::detail::address_space_fundamental< T, AS >

  Implementation of a fundamental type with an OpenCL address space. More...
- struct trisycl::detail::address_space_ptr< T, AS >

  Implementation for an OpenCL address space pointer. More...
- struct trisycl::detail::address_space_array< T, AS >

  Implementation of an array variable with an OpenCL address space. More...
- struct trisycl::detail::address_space_object< T, AS >

  Implementation of an object type with an OpenCL address space. More...

Namespaces

- namespace trisycl

  The vector type to be used as SYCL vector.
- namespace trisycl::detail

  Some global triSYCL configuration.

Macros

- #define TRISYCL_GLOBAL_AS TRISYCL_DEVICE_ONLY(__attribute__((address_space(1))))

  Address space for OpenCL __global.
- #define TRISYCL_LOCAL_AS TRISYCL_DEVICE_ONLY(__attribute__((address_space(3))))

  Address space for OpenCL __local.
- #define TRISYCL_CONSTANT_AS TRISYCL_DEVICE_ONLY(__attribute__((address_space(2))))

  Address space for OpenCL __constant.
- #define TRISYCL_GENERIC_AS TRISYCL_DEVICE_ONLY(__attribute__((address_space(4))))

  Address space for OpenCL __generic.
- #define TRISYCL_PRIVATE_AS

  Address space for OpenCL __private.

Typedefs

- template<typename T , access::address_space AS>
  using trisycl::detail::addr_space = typename std::conditional< std::is_pointer< T >::value, address_space_ptr< T, AS >, typename std::conditional< std::is_class< T >::value, address_space_object< T, AS >, typename std::conditional< std::is_array< T >::value, address_space_array< T, AS >, address_space_fundamental< T, AS > >::type >::type >::type

  Dispatch the address space implementation according to the requested type.

This graph shows which files directly or indirectly include this file:

Namespaces

- namespace trisycl

  The vector type to be used as SYCL vector.

Typedefs

- template<typename T >
  using trisycl::buffer_allocator = std::allocator< T >

  The allocator objects give the programmer some control on how the memory is allocated inside SYCL.

- template<typename T >
  using trisycl::image_allocator = std::allocator< T >

  The allocator used for the `image` inside SYCL.
- template<typename T >
  using trisycl::map_allocator = std::allocator< T >

  The allocator used to map the memory at the same place.

13.43 include/triSYCL/detail/alignment_helper.hpp File Reference

A simple trait to help generate the appropriate alignment data for a SYCL type when specified appropriately.

This graph shows which files directly or indirectly include this file:

Classes

- class trisycl::detail::alignment< T >
- class trisycl::detail::alignment<::trisycl::vec< DataType, NumElements > >

Namespaces

- namespace trisycl

  The vector type to be used as SYCL vector.
- namespace trisycl::detail

  Some global triSYCL configuration.

Variables

- template<typename T >
  constexpr auto trisycl::detail::alignment_v = alignment<T>::value

13.43.1 Detailed Description

A simple trait to help generate the appropriate alignment data for a SYCL type when specified appropriately.

Currently only used and specialized for the vec classes which have SYCL spec required alignments.

- template<typename V , typename Tuple , std::size_t... Is>
  std::array< typename V::element_type, V::dimension > trisycl::detail::tuple_to_array_iterate (Tuple t, std::index_sequence< Is... >)

  Helper to construct an array from initializer elements provided as a tuple.
- template<typename V , typename Tuple >
  auto trisycl::detail::tuple_to_array (Tuple t)

  Construct an array from initializer elements provided as a tuple.
- template<typename V , typename Tuple >
  auto trisycl::detail::expand (Tuple t)

  Create the array data of V from a tuple of initializer.

13.47.1 Detailed Description

Some helpers to do array-tuple conversions.

Used for example to implement trisycl::vec<> class.

13.55 include/triSYCL/detail/enum.hpp File Reference

Some enum-related helpers.

`#include <type_traits>`
Include dependency graph for enum.hpp:

This graph shows which files directly or indirectly include this file:

Namespaces

- namespace trisycl

  The vector type to be used as SYCL vector.
- namespace trisycl::detail

  Some global triSYCL configuration.

Variables

- auto constexpr trisycl::detail::underlying_value

  Get the enum value as an integral value of the underlying integer type.
- auto constexpr trisycl::detail::enum_distance

  Get the distance between 2 enum underlying values.
- auto constexpr trisycl::detail::enum_count

  Count the number of enums between 2 enum boundaries, including the boundaries.

13.55.1 Detailed Description

Some enum-related helpers.

  Some global triSYCL configuration.

13.61.1 Detailed Description

A Boost.Fiber pool implemented on a std::thread pool.

The use case is for circuit emulation when there are a lot of fibers launched at the beginning and they have to run concurrently.

The fiber executors can use several std::thread.

It allows the execution of some callable and return some future for later shepherding.

- namespace trisycl

  The vector type to be used as SYCL vector.
- namespace trisycl::detail

  Some global triSYCL configuration.

Functions

- template<typename KernelName , typename Functor >
  void trisycl::detail::instantiate_kernel (Functor f) noexcept

  Instantiate the kernel code.
- TRISYCL_WEAK_ATTRIB_PREFIX void TRISYCL_WEAK_ATTRIB_SUFFIX trisycl::detail::set_kernel_task_marker (detail::task &) noexcept

  Set the task to be used to launch the kernel.
- template<typename KernelName , typename Kernel >
  void trisycl::detail::launch_device_kernel (detail::task &t, Kernel k) noexcept

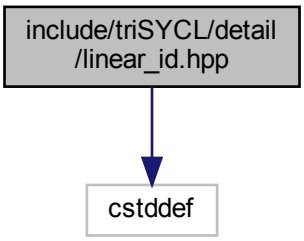
  Gather in a single function what is necessary for the device compiler to outline the kernel or to set up the kernel and serialize the arguments.

Variables

- auto trisycl::detail::prevent_arguments_from_optimization

  Avoid the interprocedural optimization to remove these arguments in the kernel instantiation by relying on some dummy static variables.

13.66 instantiate_kernel.hpp



Go to the documentation of this file.

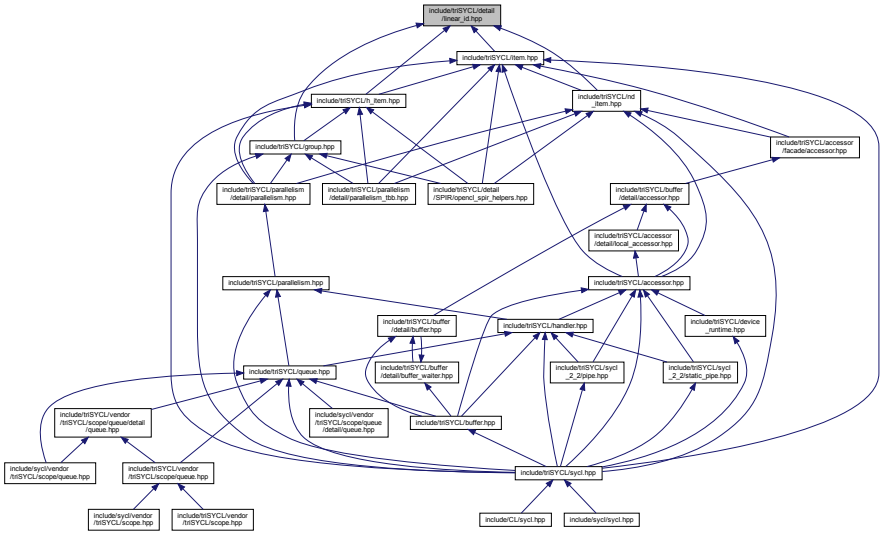
00017
00018 #include "triSYCL/command_group/detail/task.hpp"
00019
00020 namespace trisycl::detail {
00021
00022 /** Avoid the interprocedural optimization to remove these arguments
00023 in the kernel instantiation by relying on some dummy static variables.
00024
00025 Using \c [[gnu::used]] does not work on arguments but only
00026 on static variable, so use this function.
00027 */
00028 auto inline prevent_arguments_from_optimization = [] (auto & ...args) {
00029   /* Just keep track of the address of all the given objects,
00030 otherwise the objects are copied, may throw, are registered for
00031 destruction with \c atexit(), etc.  */
00032   [[gnu::used]] static auto keep = std::make_tuple(& args...);
00033 };
00034
00035
00036 /** Instantiate the kernel code
00037
00038 To have a clear view of what a kernel is at the LLVM IR level even
00039 when a lot of optimizations are done (-O3), call the kernel from
00040 this function marked as \c noinline, otherwise the kernel code is
00041 inlined directly where it is used.
00042
00043 Actually some optimizations/code restructuring might duplicate the
00044 call to \c instantiate_kernel but the \c noduplicate attribute
00045 seems incompatible with \c noinline in Clang/LLVM 3.9.1, because
00046 the inlining happen when both attributes are used...
00047 */
```



```
00048 template <typename KernelName,
00049           typename Functor>
00050 [[gnu::noinline]] void
00051 instantiate_kernel(Functor f) noexcept {
00052   /* The outlining compiler is expected to do some massage here or
00053 around and to insert some calls to \c serialize_arg and so on */
00054   f();
00055 }
00056
00057
00058 /** Set the task to be used to launch the kernel
00059
00060 This is actually a dummy function so that the device compiler can
00061 just grab the task for passing it to the argument serialization
00062 functions from the device runtime.
00063
00064 It is better to use a weak linkage than having this function with
00065 extern linkage:
00066
00067 - if the device compiler is used the function is kept by the
00068 compiler because full link and LTO is not applied before the
00069 device compiler passes are applied.  So there is no partial
00070 evaluation in the compiler according to what is returned by this
00071 function;
00072
00073 - if the device compiler is not used, the code still links and can
00074 be compiled.
00075 */
00076 TRISYCL_WEAK_ATTRIB_PREFIX void TRISYCL_WEAK_ATTRIB_SUFFIX
00077 set_kernel_task_marker(detail::task &) noexcept {
00078 }

Include dependency graph for small_array.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- struct trisycl::detail::small_array_tag

  Tag to define simply inheritance from small_array. More...
- struct trisycl::detail::small_array< BasicType, FinalType, Dims >

  Define a multi-dimensional index, used for example to locate a work item or a buffer element. More...
- struct trisycl::detail::small_array_sycl< BasicType, FinalType, Dims >

  A small array to implement SYCL objects like id, range, item... with 1, 2 or 3 elements (or even more if detail::allow_any_dimension is true), with the implicit constructors. More...
- struct std::tuple_size< T >

  Export the dimension as its tuple size.
- struct std::tuple_element< I, T >

  Each tuple element type is the same, the one of any small_array heir element.

Namespaces

- namespace trisycl

  The vector type to be used as SYCL vector.
- namespace trisycl::detail

  Some global triSYCL configuration.
- namespace std

Concepts

- concept trisycl::detail::is_small_array

  Concept describing a class inheriting from small_array.

Macros

- #define TRISYCL_BOOST_OPERATOR_VECTOR_OP(op)

  Helper macro to declare a vector operation with the given side-effect operator.
- #define TRISYCL_LOGICAL_OPERATOR_VECTOR_OP(op)

  Helper macro to declare a vector operation returning a new type containing the result of the operator.
- #define TRISYCL_UNARY_OPERATOR_VECTOR_OP(op)

  Helper macro to declare a vector unary operation.
- #define TRISYCL_UNARY_PREFIX_OPERATOR_VECTOR_OP(op)

  Helper macro to declare a vector prefix unary operation.
- #define TRISYCL_UNARY_POSTFIX_OPERATOR_VECTOR_OP(op)

  Helper macro to declare a vector prefix unary operation.
- #define TRISYCL_OPERATOR_BASIC_TYPE_OP(op)

  Helper macro to declare out-of-class operators for b vs a[] operations.

Functions

- template<std::size_t I, typename T >
  requires trisycl::detail::is_small_array<T>
  decltype(auto) std::get (T &&e)

  The element of the tuple is the matching element of the small_array heir.

Macros

- #define const_func __attribute__((const))

  Added according to pocl/examples/example1-spir64/generate_spir.sh.
- #define readonly __attribute__((pure))
- #define MAXFLOAT 0x1.fffffep127f

  Value of maximum non-infinite single-precision floating-point number.
- #define HUGE_VALF (__builtin_huge_valf())

  A positive float constant expression.
- #define HUGE_VAL (__builtin_huge_val())

  A positive double constant expression.
- #define INFINITY (__builtin_inff())

  A constant expression of type float representing positive or unsigned infinity.
- #define NAN as_float(__builtin_nanf((char const *)""))

  A constant expression of type float representing a quiet NaN.
- #define FP_ILOGB0 INT_MIN
- #define FP_ILOGBNAN INT_MAX
- #define FLT_DIG 6

Typedefs

- typedef unsigned char uchar

  An unsigned 8-bit integer.
- typedef unsigned short ushort

  An unsigned 16-bit integer.
- typedef unsigned int uint

  An unsigned 32-bit integer.
- typedef unsigned long ulong

  An unsigned 64-bit integer.
- typedef ptrdiff_t intptr_t

  The unsigned integer type of the result of the sizeof operator.
- typedef size_t uintptr_t
- typedef char char2 __attribute__((ext_vector_type(2)))

  Returns the number of global work-items specified for dimension identified by dimindx.
- typedef uint cl_mem_fence_flags

  All work-items in a work-group executing the kernel on a processor must execute this function before any are allowed to continue execution beyond the barrier.

Functions

- uint const_func __attribute__ ((overloadable)) get_work_dim(void)

  Returns the number of dimensions in use.
- int printf (__constant const char *st,...)

13.83.1 Macro Definition Documentation

13.83.1.1 __kernel_exec

```
#define __kernel_exec(
              X,
              typen )
```

Value:

```
    __kernel \
__attribute__((work_group_size_hint(X, 1, 1))) \
    __attribute__((vec_type_hint(typen)))
```

Definition at line 6483 of file opencl_spir.h.

13.83.1.2 as_char

```
#define as_char(
              x ) __builtin_astype((x), char)
```

OpenCL as_typen operators Reinterprets a data type as another data type of the same size.

Definition at line 7497 of file opencl_spir.h.

13.83.1.3 as_char16

```
#define as_char16(
              x ) __builtin_astype((x), char16)
```

Definition at line 7502 of file opencl_spir.h.

13.83.1.4 as_char2

```
#define as_char2(
              x ) __builtin_astype((x), char2)
```

Definition at line 7498 of file opencl_spir.h.

13.83.1.5 as_char3

```
#define as_char3(
              x ) __builtin_astype((x), char3)
```

Definition at line 7499 of file opencl_spir.h.

13.83.1.6 as_char4

```
#define as_char4(
              x ) __builtin_astype((x), char4)
```

Definition at line 7500 of file opencl_spir.h.

13.83.1.7 as_char8

```
#define as_char8(
              x ) __builtin_astype((x), char8)
```

Definition at line 7501 of file opencl_spir.h.

13.83.1.8 as_double

```
#define as_double(
              x ) __builtin_astype((x), double)
```

Definition at line 7567 of file opencl_spir.h.

13.83.1.9 as_double16

```
#define as_double16(
              x ) __builtin_astype((x), double16)
```

Definition at line 7572 of file opencl_spir.h.

13.83.1.10 as_double2

```
#define as_double2(
              x ) __builtin_astype((x), double2)
```

Definition at line 7568 of file opencl_spir.h.

13.83.1.11 as_double3

```
#define as_double3(
              x ) __builtin_astype((x), double3)
```

Definition at line 7569 of file opencl_spir.h.

13.83.1.12 as_double4

```
#define as_double4(
              x ) __builtin_astype((x), double4)
```

Definition at line 7570 of file opencl_spir.h.

13.83.1.13 as_double8

```
#define as_double8(
              x ) __builtin_astype((x), double8)
```

Definition at line 7571 of file opencl_spir.h.

13.83.1.14 as_float

```
#define as_float(
              x ) __builtin_astype((x), float)
```

Definition at line 7560 of file opencl_spir.h.

13.83.1.15 as_float16

```
#define as_float16(
              x ) __builtin_astype((x), float16)
```

Definition at line 7565 of file opencl_spir.h.

13.83.1.16 as_float2

```
#define as_float2(
              x ) __builtin_astype((x), float2)
```

Definition at line 7561 of file opencl_spir.h.

13.83.1.17 as_float3

```

Use the coordinate (x, y) to do an element lookup in the 2D image object specified by image.

read_imagef returns floating-point values in the range [0.0 ... 1.0] for image objects created with image_channel↩ _data_type set to one of the predefined packed formats or CL_UNORM_INT8, or CL_UNORM_INT16. read_imagef returns floating-point values in the range [-1.0 ... 1.0] for image objects created with image_channel_data_type set to CL_SNORM_INT8, or CL_SNORM_INT16. read_imagef returns floating-point values for image objects created with image_channel_data_type set to CL_HALF_FLOAT or CL_FLOAT. The read_imagef calls that take integer coordinates must use a sampler with filter mode set to CLK_FILTER_NEAREST, normalized coordinates set to CLK_NORMALIZED_COORDS_FALSE and addressing mode set to CLK_ADDRESS_CLAMP_TO_EDGE, CLK↩ _ADDRESS_CLAMP or CLK_ADDRESS_NONE; otherwise the values returned are undefined. Values returned by read_imagef for image objects with image_channel_data_type values not specified in the description above are undefined.

13.83.2 Typedef Documentation

13.83.2.1 __attribute__

```
std::size_t const_func __attribute__
```

Returns the number of global work-items specified for dimension identified by dimindx.

Write color value to location specified by coord.xy in the 2D image layer identified by index coord.z in the 2D image array.

Use coord.xy to do an element lookup in the 2D image layer identified by index coord.z in the 2D image array.

Return the number of images in the 1D image array.

Return the number of images in the 2D image array.

Return the 3D image width, height, and depth as an int4 type.

Return the 2D image width and height as an int2 type.

Return the image channel order.

Return the image depth in pixels.

Return the image height in pixels.

Return the image width in pixels.

Write color value to location specified by coordinate (x, y, z) in the 3D image object specified by image.

Use the coordinate (coord.x, coord.y, coord.z) to do an element lookup in the 3D image object specified by image.

Write color value to location specified by coordinate (x, y) in the 2D image object specified by image.

Use the coordinate (x, y) to do an element lookup in the 2D image object specified by image.

The shuffle and shuffle2 built-in functions construct a permutation of elements from one or two input vectors respectively that are of the same type, returning a vector with the same element type as the input and length that is the same as the shuffle mask.

Swaps the old value stored at location p with new value given by val.

unsigned int atomic_sub (volatile __global unsigned int *p, unsigned int val) int atomic_sub (volatile __local int *p, int val) unsigned int atomic_sub (volatile __local unsigned int *p, unsigned int val) Read the 32-bit value (referred to as old) stored at location pointed by p.

Read the 32-bit value (referred to as old) stored at location pointed by p.

Prefetch num_elements * sizeof(gentype) bytes into the global cache.

Wait for events that identify the async_work_group_copy operations to complete.

Perform an async gather of num_elements gentype elements from src to dst.

event_t async_work_group_copy (__global gentype *dst, const __local gentype *src, size_t num_elements, event_t event) Perform an async copy of num_elements gentype elements from src to dst.

Write memory barrier that orders only stores.

Read memory barrier that orders only loads.

Orders loads and stores of a work-item executing a kernel.

For n = 1, 2, 4, 8 and 16 read sizeof (halfn) bytes of data from address (p + (offset $*$ n)).

The floatn value given by data is converted to a halfn value using the appropriate rounding mode.

The float value given by data is first converted to a half value using the appropriate rounding mode.

Read sizeof (halfn) bytes of data from address (p + (offset $*$ n)).

Read sizeof (half) bytes of data from address (p + offset).

Write sizeof (gentypen) bytes given by data to address (p + (offset $*$ n)).

Return sizeof (gentypen) bytes of data read from address (p + (offset $*$ n)).

For each component of a vector type, result[i] = if MSB of c[i] is set ? b[i] : a[i].

Each bit of the result is the corresponding bit of a if the corresponding bit of c is 0.

Returns 1 if the most significant bit in all components of x is set; otherwise returns 0.

Returns 1 if the most significant bit in any component of x is set; otherwise returns 0.

Test for sign bit.

Test if arguments are unordered.

Test if arguments are ordered.

Test for a normal value.

Test for a NaN.

Test for infinity value (+ve or –ve) .

Test for finite value.

Returns the component-wise compare of (x $<$ y) $||$ (x $>$ y) .

Returns the component-wise compare of x $<$= y.

Returns the component-wise compare of x $<$ y.

Returns the component-wise compare of x $>$= y.

Returns the component-wise compare of x $>$ y.

Returns the component-wise compare of x != y.

intn isequal (floatn x, floatn y) Returns the component-wise compare of x == y.

Returns the length of vector p computed as: half_sqrt(p.x2 + p.y2 + ...)

Returns fast_length(p0 – p1).

Returns a vector in the same direction as p but with a length of 1.

Return the length of vector p, i.e., sqrt(p.x2 + p.y 2 + ...)

Returns the distance between p0 and p1.

Compute dot product.

Returns the cross product of p0.xyz and p1.xyz.

Returns 1.0 if x $>$ 0, -0.0 if x = -0.0, +0.0 if x = +0.0, or –1.0 if x $<$ 0.

Returns 0.0 if x $<=$ edge0 and 1.0 if x $>=$ edge1 and performs smooth Hermite interpolation between 0 and 1when edge0 $<$ x $<$ edge1.

Returns 0.0 if x $<$ edge, otherwise it returns 1.0.

Converts degrees to radians, i.e.

Returns the linear blend of x & y implemented as: x + (y – x) $*$ a a must be a value in the range 0.0 . . . 1.0.

Converts radians to degrees, i.e.

Returns fmin(fmax(x, minval), maxval).

Multiply two 24-bit integer values x and y.

Multiply two 24-bit integer values x and y and add the 32-bit integer result to the 32-bit integer z.

result[i] = ((long)hi[i] $<<$ 32) | lo[i] result[i] = ((ulong)hi[i] $<<$ 32) | lo[i]

result[i] = ((int)hi[i] $<<$ 16) | lo[i] result[i] = ((uint)hi[i] $<<$ 16) | lo[i]

result[i] = ((short)hi[i] $<<$ 8) | lo[i] result[i] = ((ushort)hi[i] $<<$ 8) | lo[i]

Returns x - y and saturates the result.

For each element in v, the bits are shifted left by the number of bits given by the corresponding element in i (subject to usual shift modulo rules described in section 6.3).

Computes x $*$ y and returns the high half of the product of x and y.

Returns a $*$ b + c and saturates the result.

Returns mul_hi(a, b) + c.

Returns the number of leading 0-bits in x, starting at the most significant bit position.

Returns min(max(x, minval), maxval).

Returns (x + y + 1) $>>$ 1.

Returns (x + y) $>>$ 1.

Returns x + y and saturates the result.

Returns | x – y | without modulo overflow.

Returns | x |.

Compute tangent over an implementation-defined range.

Compute square root over an implementation-defined range.

Compute sine over an implementation-defined range.

Compute inverse square root over an implementationdefined range.

Compute reciprocal over an implementation-defined range.

Compute a base 10 logarithm over an implementationdefined range.

Compute a base 2 logarithm over an implementationdefined range.

Compute natural logarithm over an implementationdefined range.

Compute the base- 10 exponential of x over an implementation-defined range.

Compute the base- 2 exponential of x over an implementation-defined range.

Compute the base- e exponential of x over an implementation-defined range.

Compute x / y over an implementation-defined range.

Compute cosine over an implementation-defined range.

Compute reciprocal.

Compute the base- 10 exponential of x.

Compute the base- 2 exponential of x.

Compute x / y.

Round to integral value using the round to zero rounding mode.

Compute the gamma function.

Compute tan (PI $*$ x).

Compute hyperbolic tangent.

Compute tangent.

Compute square root.

Compute sin (PI $*$ x).

Compute hyperbolic sine.

Compute sine and cosine of x.

Compute sine.

Compute inverse square root.

Return the integral value nearest to x rounding halfway cases away from zero, regardless of the current rounding direction.

Compute x to the power 1/y.

Round to integral value (using round to nearest even rounding mode) in floating-point format.

The remquo function computes the value r such that r = x - n∗y, where n is the integer nearest the exact value of x/y.

Compute the value r such that r = x - n∗y, where n is the integer nearest the exact value of x/y.

Compute x to the power y, where x is >= 0.

Compute x to the power y, where y is an integer.

Compute x to the power y.

Computes the next representable single-precision floating-point value following x in the direction of y.

Returns a quiet NaN.

Decompose a floating-point number.

Returns x if | x | < | y |, y if | y | < | x |, otherwise fmin(x, y).

Returns x if | x | > | y |, y if | y | > | x |, otherwise fmax(x, y).

mad approximates a ∗ b + c.

Compute the exponent of x, which is the integral part of logr | x |.

Compute a base e logarithm of (1.0 + x).

Compute a base 10 logarithm.

Compute a base 2 logarithm.

Compute natural logarithm.

Log gamma function.

Multiply x by 2 to the power n.

Return the exponent as an integer value.

Compute the value of the square root of x^2+ y^2 without undue overflow or underflow.

Extract mantissa and exponent from x.

Returns fmin(x – floor (x), 0x1.fffffep-1f).

Modulus.

Returns y if y < x, otherwise it returns x.

Returns y if x < y, otherwise it returns x.

Returns the correctly rounded floating-point representation of the sum of c with the infinitely precise product of a and b.

Round to integral value using the round to –ve infinity rounding mode.

x - y if x > y, +0 if x is less than or equal to y.

Compute absolute value of a floating-point number.

Compute e^x- 1.0.

Exponential base 10 function.

Exponential base 2 function.

Compute the base- e exponential of x.

Error function encountered in integrating the normal distribution.

Complementary error function.

Compute cos (PI $*$ x).

Compute hyperbolic consine.

Compute cosine.

Returns x with its sign changed to match the sign of y.

Round to integral value using the round to +ve infinity rounding mode.

Compute cube-root.

Compute atan2 (y, x) / PI.

Compute atan (x) / PI.

Hyperbolic arc tangent.

Arc tangent of y / x.

Arc tangent function.

Compute asin (x) / PI.

Inverse hyperbolic sine.

Arc sine function.

Compute acos (x) / PI.

Inverse hyperbolic cosine.

Arc cosine function.

get_global_offset returns the offset values specified in global_work_offset argument to clEnqueueNDRangeKernel.

get_group_id returns the work-group ID which is a number from 0 .

Returns the number of work-groups that will execute a kernel for dimension identified by dimindx.

Returns the unique local work-item ID i.e.

Returns the number of local work-items specified in dimension identified by dimindx.

Returns the unique global work-item ID value for dimension identified by dimindx.

This value is given by the global_work_size argument to clEnqueueNDRangeKernel. Valid values of dimindx are 0 to get_work_dim() – 1. For other values of dimindx, get_global_size() returns 1. For clEnqueueTask, this always returns 1.

The global work-item ID specifies the work-item ID based on the number of global work-items specified to execute the kernel. Valid values of dimindx are 0 to get_work_dim() – 1. For other values of dimindx, get_global_id() returns 0. For clEnqueueTask, this returns 0.

This value is given by the local_work_size argument to clEnqueueNDRangeKernel if local_work_size is not NULL; otherwise the OpenCL implementation chooses an appropriate local_work_size value which is returned by this function. Valid values of dimindx are 0 to get_work_dim() – 1. For other values of dimindx, get_local_size() returns 1. For clEnqueueTask, this always returns 1.

a work-item within a specific work-group for dimension identified by dimindx. Valid values of dimindx are 0 to get_work_dim() – 1. For other values of dimindx, get_local_id() returns 0. For clEnqueueTask, this returns 0.

Valid values of dimindx are 0 to get_work_dim() – 1. For other values of dimindx, get_num_groups () returns 1. For clEnqueueTask, this always returns 1.

. get_num_groups(dimindx) – 1. Valid values of dimindx are 0 to get_work_dim() – 1. For other values, get_group↩ _id() returns 0. For clEnqueueTask, this returns 0.

Valid values of dimindx are 0 to get_work_dim() – 1. For other values, get_global_offset() returns 0. For cl↩ EnqueueTask, this returns 0.

Rounding of intermediate products shall not occur. Edge case behavior is per the IEEE 754-2008 standard.

If one argument is a NaN, fmax() returns the other argument. If both arguments are NaNs, fmax() returns a NaN.

If one argument is a NaN, fmin() returns the other argument. If both arguments are NaNs, fmin() returns a NaN.

Returns x – y ∗ trunc (x/y).

floor(x) is returned in iptr.

For each component the mantissa returned is a float with magnitude in the interval [1/2, 1) or 0. Each component of x equals mantissa returned ∗ 2^exp.

Returns the natural logarithm of the absolute value of the gamma function. The sign of the gamma function is returned in the signp argument of lgamma_r.

Whether or how the product of a ∗ b is rounded and how supernormal or subnormal intermediate products are handled is not defined. mad is intended to be used where speed is preferred over accuracy.

The modf function breaks the argument x into integral and fractional parts, each of which has the same sign as the argument. It stores the integral part in the object pointed to by iptr.

The nancode may be placed in the significand of the resulting NaN.

Thus, if y is less than x, nextafter() returns the largest representable floating-point number less than x.

If there are two integers closest to x/y, n shall be the even one. If r is zero, it is given the same sign as x.

If there are two integers closest to x/y, n shall be the even one. If r is zero, it is given the same sign as x. This is the same value that is returned by the remainder function. remquo also calculates the lower seven bits of the integral quotient x/y, and gives that value the same sign as x/y. It stores this signed value in the object pointed to by quo.

Refer to section 7.1 for description of rounding modes.

The computed sine is the return value and computed cosine is returned in cosval.

x must be in the range -2^16 ... +2^16.

x must be in the range -2^16 ... +2^16.

x must be in the range -216 ... +216.

The maximum error is implementation-defined.

The maximum error is implementation defined.

The maximum error is implementationdefined.

The range of x and y are implementation-defined. The maximum error is implementation-defined.

The intermediate sum does not modulo overflow.

Results are undefined if minval > maxval.

Bits shifted off the left side of the element are shifted back in from the right.

Refer to definition of mul24 to see how the 24-bit integer multiplication is performed.

x and y are 32-bit integers but only the low 24-bits are used to perform the multiplication. mul24 should only be used when values in x and y are in the range [- 2^23, 2^23-1] if x and y are signed integers and in the range [0, 2^24-1] if x and y are unsigned integers. If x and y are not in this range, the multiplication result is implementation-defined.

(180 / PI) ∗ radians.

If x and y are infinite or NaN, the return values are undefined.

If a is not in the range 0.0 ... 1.0, the return values are undefined.

(PI / 180) ∗ degrees.

This is useful in cases where you would want a threshold function with a smooth transition. This is equivalent to: gentype t; t = clamp ((x – edge0) / (edge1 – edge0), 0, 1); return t ∗ t ∗ (3 – 2 ∗ t); Results are undefined if edge0 >= edge1 or if x, edge0 or edge1 is a NaN.

Returns 0.0 if x is a NaN.

The w component of float4 result returned will be 0.0.

This is calculated as length(p0 – p1).

fast_normalize is computed as: p ∗ half_rsqrt (p.x^2 + p.y^2 + ...) The result shall be within 8192 ulps error from the infinitely precise result of if (all(p == 0.0f)) result = p; else result = p / sqrt (p.x^2 + p.y^2 + ...); with the following exceptions: 1) If the sum of squares is greater than FLT_MAX then the value of the floating-point values in the result vector are undefined. 2) If the sum of squares is less than FLT_MIN then the implementation may return back p. 3) If the device is in “denorms are flushed to zero” mode, individual operand elements with magnitude less than sqrt(FLT_MIN) may be flushed to zero before proceeding with the calculation.

isordered() takes arguments x and y, and returns the result isequal(x, x) && isequal(y, y).

isunordered() takes arguments x and y, returning non-zero if x or y is NaN, and zero otherwise.

The scalar version of the function returns a 1 if the sign bit in the float is set else returns 0. The vector version of the function returns the following for each component in floatn: a -1 if the sign bit in the float is set else returns 0.

Otherwise it is the corresponding bit of b.

For a scalar type, result = c ? b : a.

The address computed as (p + (offset ∗ n)) must be 8-bit aligned if gentype is char, uchar; 16-bit aligned if gentype is short, ushort; 32-bit aligned if gentype is int, uint, float; 64-bit aligned if gentype is long, ulong.

The data read is interpreted as a half value. The half value is converted to a float value and the float value is returned. The read address computed as (p + offset) must be 16-bit aligned.

The data read is interpreted as a halfn value. The halfn value read is converted to a floatn value and the floatn value is returned. The read address computed as (p + (offset ∗ n)) must be 16-bit aligned.

The half value is then written to address computed as (p + offset). The address computed as (p + offset) must be 16- bit aligned. vstore_half use the current rounding mode. The default current rounding mode is round to nearest even.

The halfn value is then written to address computed as (p + (offset ∗ n)). The address computed as (p + (offset ∗ n)) must be 16-bit aligned. vstore_halfn uses the current rounding mode. The default current rounding mode is round to nearest even.

The data read is interpreted as a halfn value. The halfn value read is converted to a floatn value and the floatn value is returned. The address computed as (p + (offset ∗ n)) must be aligned to sizeof (halfn) bytes. For n = 3, vloada_half3 reads a half3 from address (p + (offset ∗ 4)) and returns a float3. The address computed as (p + (offset ∗ 4)) must be aligned to sizeof (half) ∗ 4 bytes.

For n = 1, 2, 4, 8 and 16, the halfn value is written to the address computed as (p + (offset

- n)). The address computed as (p + (offset ∗ n)) must be aligned to sizeof (halfn) bytes. For n = 3, the half3 value is written to the address computed as (p + (offset ∗ 4)). The address computed as (p + (offset ∗ 4)) must be aligned to sizeof (half) ∗ 4 bytes. vstorea_halfn uses the current rounding mode. The default current rounding mode is round to nearest even.

  This means that loads and stores preceding the mem_fence will be committed to memory before any loads and stores following the mem_fence. The flags argument specifies the memory address space and can be set to a combination of the following literal values: CLK_LOCAL_MEM_FENCE CLK_GLOBAL_MEM_FENCE.

The flags argument specifies the memory address space and can be set to to a combination of the following literal values: CLK_LOCAL_MEM_FENCE CLK_GLOBAL_MEM_FENCE.

The async copy is performed by all work-items in a workgroup and this built-in function must therefore be encountered by all work-items in a workgroup executing the kernel with the same argument values; otherwise the results are undefined. Returns an event object that can be used by wait_group_events to wait for the async copy to finish. The event argument can also be used to associate the async_work_group_copy with a previous async copy allowing an event to be shared by multiple async copies; otherwise event should be zero. If event argument is non-zero, the event object supplied in event argument will be returned. This function does not perform any implicit synchronization of source data such as using a barrier before performing the copy.

The src_stride is the stride in elements for each gentype element read from src. The dst_stride is the stride in elements for each gentype element written to dst. The async gather is performed by all work-items in a work-group. This built-in function must therefore be encountered by all work-items in a work-group executing the kernel with the same argument values; otherwise the results are undefined. Returns an event object that can be used by wait_group_events to wait for the async copy to finish. The event argument can also be used to associate the async_work_group_strided_copy with a previous async copy allowing an event to be shared by multiple async copies; otherwise event should be zero. If event argument is non-zero, the event object supplied in event argument will be returned. This function does not perform any implicit synchronization of source data such as using a barrier before performing the copy.

The event objects specified in event_list will be released after the wait is performed. This function must be encountered by all workitems in a work-group executing the kernel with the same num_events and event objects specified in event_list; otherwise the results are undefined.

The prefetch instruction is applied to a work-item in a workgroup and does not affect the functional behavior of the kernel.

Compute (old + val) and store result at location pointed by p. The function returns old.

Compute (old - val) and store result at location pointed by p. The function returns old.

Returns old value.

Compute (old + 1) and store result at location pointed by p. The function returns old.

Compute (old - 1) and store result at location pointed by p. The function returns old.

Compute (old == cmp) ? val : old and store result at location pointed by p. The function returns old.

Compute min(old, val) and store minimum value at location pointed by p. The function returns old.

Compute max(old, val) and store maximum value at location pointed by p. The function returns old.

Compute (old & val) and store result at location pointed by p. The function returns old.

Compute (old | val) and store result at location pointed by p. The function returns old.

Compute (old ^ val) and store result at location pointed by p. The function returns old.

The size of each element in the mask must match the size of each element in the result. For shuffle, only the ilogb(2m-1) least significant bits of each mask element are considered. For shuffle2, only the ilogb(2m-1)+1 least significant bits of each mask element are considered. Other bits in the mask shall be ignored. The elements of the input vectors are numbered from left to right across one or both of the vectors. For this purpose, the number of elements in a vector is given by vec_step(gentypem). The shuffle mask operand specifies, for each element of the result vector, which element of the one or two input vectors the result element gets. Examples: uint4 mask = (uint4)(3, 2, 1, 0); float4 a; float4 r = shuffle(a, mask); // r.s0123 = a.wzyx uint8 mask = (uint8)(0, 1, 2, 3, 4, 5, 6, 7); float4 a, b; float8 r = shuffle2(a, b, mask); // r.s0123 = a.xyzw // r.s4567 = b.xyzw uint4 mask; float8 a; float4 b; b = shuffle(a, mask); Examples that are not valid are: uint8 mask; short16 a; short8 b; b = shuffle(a, mask); <- not valid

read_imagei and read_imageui return unnormalized signed integer and unsigned integer values respectively. Each channel will be stored in a 32-bit integer. read_imagei can only be used with image objects created with image_channel_data_type set to one of the following values: CL_SIGNED_INT8, CL_SIGNED_INT16 and CL_SIGNED_INT32. If the image_channel_data_type is not one of the above values, the values returned by read_imagei are undefined. read_imageui can only be used with image objects created with image_channel_data_type set to one of the following values: CL_UNSIGNED_INT8, CL_UNSIGNED_INT16 and CL_UNSIGNED_INT32. If the image_channel_data_type is not one of the above values, the values returned by read_imageui are undefined. The read_image{i|ui} calls support a nearest filter only. The filter_mode specified in sampler must be set to CLK_FILTER_NEAREST; otherwise the values returned are undefined. Furthermore, the read_image{i|ui} calls that take integer coordinates must use a sampler with normalized coordinates set to CLK_NORMALIZED_COORDS_FALSE and addressing mode set to CLK_ADDRESS_CLAMP_TO_EDGE, CLK_ADDRESS_CLAMP or CLK_ADDRESS_NONE; otherwise the values returned are undefined.

Appropriate data format conversion to the specified image format is done before writing the color value. x & y are considered to be unnormalized coordinates and must be in the range 0 ... image width - 1, and 0 ... image height - 1. write_imagef can only be used with image objects created with image_channel_data_type set to one of the pre-defined packed formats or set to CL_SNORM_INT8, CL_UNORM_INT8, CL_SNORM_INT16, CL_UNORM_INT16, CL_HALF_FLOAT or CL_FLOAT. Appropriate data format conversion will be done to convert channel data from a floating-point value to actual data format in which the channels are stored. write_imagei can only be used with image objects created with image_channel_data_type set to one of the following values: CL_SIGNED_INT8,

CL_SIGNED_INT16 and CL_SIGNED_INT32. write_imageui can only be used with image objects created with image_channel_data_type set to one of the following values: CL_UNSIGNED_INT8, CL_UNSIGNED_INT16 and CL_UNSIGNED_INT32. The behavior of write_imagef, write_imagei and write_imageui for image objects created with image_channel_data_type values not specified in the description above or with (x, y) coordinate values that are not in the range (0 ... image width - 1, 0 ... image height - 1), respectively, is undefined.

coord.w is ignored. read_imagef returns floating-point values in the range [0.0 ... 1.0] for image objects created with image_channel_data_type set to one of the predefined packed formats or CL_UNORM_INT8, or CL_UNORM_↩ INT16. read_imagef returns floating-point values in the range [-1.0 ... 1.0] for image objects created with image↩ _channel_data_type set to CL_SNORM_INT8, or CL_SNORM_INT16. read_imagef returns floating-point values for image objects created with image_channel_data_type set to CL_HALF_FLOAT or CL_FLOAT. The read_imagef calls that take integer coordinates must use a sampler with filter mode set to CLK_FILTER_NEAREST, normalized coordinates set to CLK_NORMALIZED_COORDS_FALSE and addressing mode set to CLK_ADDRESS_CLAMP↩ _TO_EDGE, CLK_ADDRESS_CLAMP or CLK_ADDRESS_NONE; otherwise the values returned are undefined. Values returned by read_imagef for image objects with image_channel_data_type values not specified in the description are undefined.

coord.w is ignored. read_imagei and read_imageui return unnormalized signed integer and unsigned integer values respectively. Each channel will be stored in a 32-bit integer. read_imagei can only be used with image objects created with image_channel_data_type set to one of the following values: CL_SIGNED_INT8, CL_SIGNED_INT16 and CL_SIGNED_INT32. If the image_channel_data_type is not one of the above values, the values returned by read_imagei are undefined. read_imageui can only be used with image objects created with image_channel_↩ data_type set to one of the following values: CL_UNSIGNED_INT8, CL_UNSIGNED_INT16 and CL_UNSIGNED↩ _INT32. If the image_channel_data_type is not one of the above values, the values returned by read_imageui are undefined. The read_image{i|ui} calls support a nearest filter only. The filter_mode specified in sampler must be set to CLK_FILTER_NEAREST; otherwise the values returned are undefined. Furthermore, the read_image{i|ui} calls that take integer coordinates must use a sampler with normalized coordinates set to CLK_NORMALIZED_↩ COORDS_FALSE and addressing mode set to CLK_ADDRESS_CLAMP_TO_EDGE, CLK_ADDRESS_CLAMP or CLK_ADDRESS_NONE; otherwise the values returned are undefined.

Valid values are: CLK_A CLK_R CLK_Rx CLK_RG CLK_RGx CLK_RA CLK_RGB CLK_RGBx CLK_RGBA CLK↩ _ARGB CLK_BGRA CLK_INTENSITY CLK_LUMINANCE

The width is returned in the x component, and the height in the y component.

The width is returned in the x component, height in the y component, depth in the z component and the w component is 0.

Definition at line 77 of file opencl_spir.h.

13.83.2.2 cl_mem_fence_flags

```
typedef uint cl_mem_fence_flags
```

All work-items in a work-group executing the kernel on a processor must execute this function before any are allowed to continue execution beyond the barrier.

This function must be encountered by all work-items in a work-group executing the kernel. If barrier is inside a conditional statement, then all work-items must enter the conditional if any work-item enters the conditional statement and executes the barrier. If barrer is inside a loop, all work-items must execute the barrier for each iteration of the loop before any are allowed to continue execution beyond the barrier. The barrier function also queues a memory fence (reads and writes) to ensure correct ordering of memory operations to local or global memory. The flags argument specifies the memory address space and can be set to a combination of the following literal values. CLK_LOCAL_MEM_FENCE - The barrier function will either flush any variables stored in local memory or queue a memory fence to ensure correct ordering of memory operations to local memory. CLK_GLOBAL_MEM_FENCE – The barrier function will queue a memory fence to ensure correct ordering of memory operations to global memory. This can be useful when work-items, for example, write to buffer or image objects and then want to read the updated data.

13.83.3 Function Documentation

13.83.3.1 __attribute__()

```
uint const_func __attribute__ (
             (overloadable)  )
```

Returns the number of dimensions in use.

Write color value to location specified by coord.xy in the 2D image layer identified by index coord.z in the 2D image array.

Use coord.xy to do an element lookup in the 2D image layer identified by index coord.z in the 2D image array.

Return the number of images in the 1D image array.

Return the number of images in the 2D image array.

Return the 3D image width, height, and depth as an int4 type.

Return the 2D image width and height as an int2 type.

Return the image channel order.

Return the image depth in pixels.

Return the image height in pixels.

Return the image width in pixels.

Write color value to location specified by coordinate (x, y, z) in the 3D image object specified by image.

Use the coordinate (coord.x, coord.y, coord.z) to do an element lookup in the 3D image object specified by image.

Write color value to location specified by coordinate (x, y) in the 2D image object specified by image.

Use the coordinate (x, y) to do an element lookup in the 2D image object specified by image.

The shuffle and shuffle2 built-in functions construct a permutation of elements from one or two input vectors respectively that are of the same type, returning a vector with the same element type as the input and length that is the same as the shuffle mask.

Swaps the old value stored at location p with new value given by val.

unsigned int atomic_sub (volatile __global unsigned int *p, unsigned int val) int atomic_sub (volatile __local int *p, int val) unsigned int atomic_sub (volatile __local unsigned int *p, unsigned int val) Read the 32-bit value (referred to as old) stored at location pointed by p.

Read the 32-bit value (referred to as old) stored at location pointed by p.

Prefetch num_elements * sizeof(gentype) bytes into the global cache.

Wait for events that identify the async_work_group_copy operations to complete.

Perform an async gather of num_elements gentype elements from src to dst.

event_t async_work_group_copy (__global gentype *dst, const __local gentype *src, size_t num_elements, event_t event) Perform an async copy of num_elements gentype elements from src to dst.

Write memory barrier that orders only stores.

Read memory barrier that orders only loads.

Orders loads and stores of a work-item executing a kernel.

For n = 1, 2, 4, 8 and 16 read sizeof (halfn) bytes of data from address (p + (offset * n)).

The floatn value given by data is converted to a halfn value using the appropriate rounding mode.

The float value given by data is first converted to a half value using the appropriate rounding mode.

Read sizeof (halfn) bytes of data from address (p + (offset * n)).

Read sizeof (half) bytes of data from address (p + offset).

Write sizeof (gentypen) bytes given by data to address (p + (offset * n)).

Return sizeof (gentypen) bytes of data read from address (p + (offset * n)).

For each component of a vector type, result[i] = if MSB of c[i] is set ? b[i] : a[i].

Each bit of the result is the corresponding bit of a if the corresponding bit of c is 0.

Returns 1 if the most significant bit in all components of x is set; otherwise returns 0.

Returns 1 if the most significant bit in any component of x is set; otherwise returns 0.

Test for sign bit.

Test if arguments are unordered.

Test if arguments are ordered.

Test for a normal value.

Test for a NaN.

Test for infinity value (+ve or –ve) .

Test for finite value.

Returns the component-wise compare of (x < y) || (x > y) .

Returns the component-wise compare of x <= y.

Returns the component-wise compare of x $<$ y.

Returns the component-wise compare of x $>=$ y.

Returns the component-wise compare of x $>$ y.

Returns the component-wise compare of x != y.

intn isequal (floatn x, floatn y) Returns the component-wise compare of x == y.

Returns the length of vector p computed as: half_sqrt(p.x2 + p.y2 + ...)

Returns fast_length(p0 – p1).

Returns a vector in the same direction as p but with a length of 1.

Return the length of vector p, i.e., sqrt(p.x2 + p.y 2 + ...)

Returns the distance between p0 and p1.

Compute dot product.

Returns the cross product of p0.xyz and p1.xyz.

Returns 1.0 if x $>$ 0, -0.0 if x = -0.0, +0.0 if x = +0.0, or –1.0 if x $<$ 0.

Returns 0.0 if x $<=$ edge0 and 1.0 if x $>=$ edge1 and performs smooth Hermite interpolation between 0 and 1when edge0 $<$ x $<$ edge1.

Returns 0.0 if x $<$ edge, otherwise it returns 1.0.

Converts degrees to radians, i.e.

Returns the linear blend of x & y implemented as: x + (y – x) $*$ a a must be a value in the range 0.0 . . . 1.0.

Converts radians to degrees, i.e.

Returns fmin(fmax(x, minval), maxval).

Multiply two 24-bit integer values x and y.

Multiply two 24-bit integer values x and y and add the 32-bit integer result to the 32-bit integer z.

result[i] = ((long)hi[i] $<<$ 32) | lo[i] result[i] = ((ulong)hi[i] $<<$ 32) | lo[i]

result[i] = ((int)hi[i] $<<$ 16) | lo[i] result[i] = ((uint)hi[i] $<<$ 16) | lo[i]

result[i] = ((short)hi[i] $<<$ 8) | lo[i] result[i] = ((ushort)hi[i] $<<$ 8) | lo[i]

Returns x - y and saturates the result.

For each element in v, the bits are shifted left by the number of bits given by the corresponding element in i (subject to usual shift modulo rules described in section 6.3).

Computes x $*$ y and returns the high half of the product of x and y.

Returns a $*$ b + c and saturates the result.

Returns mul_hi(a, b) + c.

Returns the number of leading 0-bits in x, starting at the most significant bit position.

Returns min(max(x, minval), maxval).

Returns (x + y + 1) $>>$ 1.

Returns (x + y) $>>$ 1.

Returns x + y and saturates the result.

Returns $|$ x – y $|$ without modulo overflow.

Returns $|$ x $|$.

Compute tangent over an implementation-defined range.

Compute square root over an implementation-defined range.

Compute sine over an implementation-defined range.

Compute inverse square root over an implementationdefined range.

Compute reciprocal over an implementation-defined range.

Compute a base 10 logarithm over an implementationdefined range.

Compute a base 2 logarithm over an implementationdefined range.

Compute natural logarithm over an implementationdefined range.

Compute the base- 10 exponential of x over an implementation-defined range.

Compute the base- 2 exponential of x over an implementation-defined range.

Compute the base- e exponential of x over an implementation-defined range.

Compute x / y over an implementation-defined range.

Compute cosine over an implementation-defined range.

Compute reciprocal.

Compute the base- 10 exponential of x.

Compute the base- 2 exponential of x.

Compute x / y.

Round to integral value using the round to zero rounding mode.

Compute the gamma function.

Compute tan (PI $*$ x).

Compute hyperbolic tangent.

Compute tangent.

Compute square root.

Compute sin (PI $*$ x).

Compute hyperbolic sine.

Compute sine and cosine of x.

Compute sine.

Compute inverse square root.

Return the integral value nearest to x rounding halfway cases away from zero, regardless of the current rounding direction.

Compute x to the power 1/y.

Round to integral value (using round to nearest even rounding mode) in floating-point format.

The remquo function computes the value r such that r = x - n$*$y, where n is the integer nearest the exact value of x/y.

Compute the value r such that r = x - n$*$y, where n is the integer nearest the exact value of x/y.

Compute x to the power y, where x is $>=$ 0.

Compute x to the power y, where y is an integer.

Compute x to the power y.

Computes the next representable single-precision floating-point value following x in the direction of y.

Returns a quiet NaN.

Decompose a floating-point number.

Returns x if $\mid$ x $\mid$ $<$ $\mid$ y $\mid$, y if $\mid$ y $\mid$ $<$ $\mid$ x $\mid$, otherwise fmin(x, y).

Returns x if $\mid$ x $\mid$ $>$ $\mid$ y $\mid$, y if $\mid$ y $\mid$ $>$ $\mid$ x $\mid$, otherwise fmax(x, y).

mad approximates a $*$ b + c.

Compute the exponent of x, which is the integral part of logr $\mid$ x $\mid$.

Compute a base e logarithm of (1.0 + x).

Compute a base 10 logarithm.

Compute a base 2 logarithm.

Compute natural logarithm.

Log gamma function.

Multiply x by 2 to the power n.

Return the exponent as an integer value.

Compute the value of the square root of x^2+ y^2 without undue overflow or underflow.

Extract mantissa and exponent from x.

Returns fmin(x – floor (x), 0x1.fffffep-1f).

Modulus.

Returns y if y $<$ x, otherwise it returns x.

Returns y if x $<$ y, otherwise it returns x.

Returns the correctly rounded floating-point representation of the sum of c with the infinitely precise product of a and b.

Round to integral value using the round to –ve infinity rounding mode.

x - y if x $>$ y, +0 if x is less than or equal to y.

Compute absolute value of a floating-point number.

Compute e^x- 1.0.

Exponential base 10 function.

Exponential base 2 function.

Compute the base- e exponential of x.

Error function encountered in integrating the normal distribution.

Complementary error function.

Compute cos (PI $*$ x).

Compute hyperbolic consine.

Compute cosine.

Returns x with its sign changed to match the sign of y.

Round to integral value using the round to +ve infinity rounding mode.

Compute cube-root.

Compute atan2 (y, x) / PI.

Compute atan (x) / PI.

Hyperbolic arc tangent.

Arc tangent of y / x.

Arc tangent function.

Compute asin (x) / PI.

Inverse hyperbolic sine.

Arc sine function.

Compute acos (x) / PI.

Inverse hyperbolic cosine.

Arc cosine function.

get_global_offset returns the offset values specified in global_work_offset argument to clEnqueueNDRangeKernel.

get_group_id returns the work-group ID which is a number from 0 .

Returns the number of work-groups that will execute a kernel for dimension identified by dimindx.

Returns the unique local work-item ID i.e.

Returns the number of local work-items specified in dimension identified by dimindx.

Returns the unique global work-item ID value for dimension identified by dimindx.

Returns the number of global work-items specified for dimension identified by dimindx.

This is the value given to the work_dim argument specified in clEnqueueNDRangeKernel. For clEnqueueTask, this returns 1.

This value is given by the global_work_size argument to clEnqueueNDRangeKernel. Valid values of dimindx are 0 to get_work_dim() – 1. For other values of dimindx, get_global_size() returns 1. For clEnqueueTask, this always returns 1.

The global work-item ID specifies the work-item ID based on the number of global work-items specified to execute the kernel. Valid values of dimindx are 0 to get_work_dim() – 1. For other values of dimindx, get_global_id() returns 0. For clEnqueueTask, this returns 0.

This value is given by the local_work_size argument to clEnqueueNDRangeKernel if local_work_size is not NULL; otherwise the OpenCL implementation chooses an appropriate local_work_size value which is returned by this function. Valid values of dimindx are 0 to get_work_dim() – 1. For other values of dimindx, get_local_size() returns 1. For clEnqueueTask, this always returns 1.

a work-item within a specific work-group for dimension identified by dimindx. Valid values of dimindx are 0 to get_work_dim() – 1. For other values of dimindx, get_local_id() returns 0. For clEnqueueTask, this returns 0.

Valid values of dimindx are 0 to get_work_dim() – 1. For other values of dimindx, get_num_groups () returns 1. For clEnqueueTask, this always returns 1.

. get_num_groups(dimindx) – 1. Valid values of dimindx are 0 to get_work_dim() – 1. For other values, get_group↩ _id() returns 0. For clEnqueueTask, this returns 0.

Valid values of dimindx are 0 to get_work_dim() – 1. For other values, get_global_offset() returns 0. For cl↩ EnqueueTask, this returns 0.

Rounding of intermediate products shall not occur. Edge case behavior is per the IEEE 754-2008 standard.

If one argument is a NaN, fmax() returns the other argument. If both arguments are NaNs, fmax() returns a NaN.

If one argument is a NaN, fmin() returns the other argument. If both arguments are NaNs, fmin() returns a NaN.

Returns x – y ∗ trunc (x/y).

floor(x) is returned in iptr.

For each component the mantissa returned is a float with magnitude in the interval [1/2, 1) or 0. Each component of x equals mantissa returned ∗ 2^exp.

Returns the natural logarithm of the absolute value of the gamma function. The sign of the gamma function is returned in the signp argument of lgamma_r.

Whether or how the product of a $*$ b is rounded and how supernormal or subnormal intermediate products are handled is not defined. mad is intended to be used where speed is preferred over accuracy.

The modf function breaks the argument x into integral and fractional parts, each of which has the same sign as the argument. It stores the integral part in the object pointed to by iptr.

The nancode may be placed in the significand of the resulting NaN.

Thus, if y is less than x, nextafter() returns the largest representable floating-point number less than x.

If there are two integers closest to x/y, n shall be the even one. If r is zero, it is given the same sign as x.

If there are two integers closest to x/y, n shall be the even one. If r is zero, it is given the same sign as x. This is the same value that is returned by the remainder function. remquo also calculates the lower seven bits of the integral quotient x/y, and gives that value the same sign as x/y. It stores this signed value in the object pointed to by quo.

Refer to section 7.1 for description of rounding modes.

The computed sine is the return value and computed cosine is returned in cosval.

x must be in the range -2^16 ... +2^16.

x must be in the range -2^16 ... +2^16.

x must be in the range -216 ... +216.

The maximum error is implementation-defined.

The maximum error is implementation defined.

The maximum error is implementationdefined.

The range of x and y are implementation-defined. The maximum error is implementation-defined.

The intermediate sum does not modulo overflow.

Results are undefined if minval $>$ maxval.

Bits shifted off the left side of the element are shifted back in from the right.

Refer to definition of mul24 to see how the 24-bit integer multiplication is performed.

x and y are 32-bit integers but only the low 24-bits are used to perform the multiplication. mul24 should only be used when values in x and y are in the range [- 2^23, 2^23-1] if x and y are signed integers and in the range [0, 2^24-1] if x and y are unsigned integers. If x and y are not in this range, the multiplication result is implementation-defined.

(180 / PI) $*$ radians.

If x and y are infinite or NaN, the return values are undefined.

If a is not in the range 0.0 ... 1.0, the return values are undefined.

(PI / 180) $*$ degrees.

This is useful in cases where you would want a threshold function with a smooth transition. This is equivalent to: gentype t; t = clamp ((x – edge0) / (edge1 – edge0), 0, 1); return t $*$ t $*$ (3 – 2 $*$ t); Results are undefined if edge0 $>=$ edge1 or if x, edge0 or edge1 is a NaN.

Returns 0.0 if x is a NaN.

The w component of float4 result returned will be 0.0.

This is calculated as length(p0 – p1).

fast_normalize is computed as: p ∗ half_rsqrt (p.x^2 + p.y^2 + . . .) The result shall be within 8192 ulps error from the infinitely precise result of if (all(p == 0.0f)) result = p; else result = p / sqrt (p.x^2 + p.y^2 + ...); with the following exceptions: 1) If the sum of squares is greater than FLT_MAX then the value of the floating-point values in the result vector are undefined. 2) If the sum of squares is less than FLT_MIN then the implementation may return back p. 3) If the device is in "denorms are flushed to zero" mode, individual operand elements with magnitude less than sqrt(FLT_MIN) may be flushed to zero before proceeding with the calculation.

isordered() takes arguments x and y, and returns the result isequal(x, x) && isequal(y, y).

isunordered() takes arguments x and y, returning non-zero if x or y is NaN, and zero otherwise.

The scalar version of the function returns a 1 if the sign bit in the float is set else returns 0. The vector version of the function returns the following for each component in floatn: a -1 if the sign bit in the float is set else returns 0.

Otherwise it is the corresponding bit of b.

For a scalar type, result = c ? b : a.

The address computed as (p + (offset ∗ n)) must be 8-bit aligned if gentype is char, uchar; 16-bit aligned if gentype is short, ushort; 32-bit aligned if gentype is int, uint, float; 64-bit aligned if gentype is long, ulong.

The data read is interpreted as a half value. The half value is converted to a float value and the float value is returned. The read address computed as (p + offset) must be 16-bit aligned.

The data read is interpreted as a halfn value. The halfn value read is converted to a floatn value and the floatn value is returned. The read address computed as (p + (offset ∗ n)) must be 16-bit aligned.

The half value is then written to address computed as (p + offset). The address computed as (p + offset) must be 16- bit aligned. vstore_half use the current rounding mode. The default current rounding mode is round to nearest even.

The halfn value is then written to address computed as (p + (offset ∗ n)). The address computed as (p + (offset ∗ n)) must be 16-bit aligned. vstore_halfn uses the current rounding mode. The default current rounding mode is round to nearest even.

The data read is interpreted as a halfn value. The halfn value read is converted to a floatn value and the floatn value is returned. The address computed as (p + (offset ∗ n)) must be aligned to sizeof (halfn) bytes. For n = 3, vloada_half3 reads a half3 from address (p + (offset ∗ 4)) and returns a float3. The address computed as (p + (offset ∗ 4)) must be aligned to sizeof (half) ∗ 4 bytes.

For n = 1, 2, 4, 8 and 16, the halfn value is written to the address computed as (p + (offset

- n)). The address computed as (p + (offset ∗ n)) must be aligned to sizeof (halfn) bytes. For n = 3, the half3 value is written to the address computed as (p + (offset ∗ 4)). The address computed as (p + (offset ∗ 4)) must be aligned to sizeof (half) ∗ 4 bytes. vstorea_halfn uses the current rounding mode. The default current rounding mode is round to nearest even.

  This means that loads and stores preceding the mem_fence will be committed to memory before any loads and stores following the mem_fence. The flags argument specifies the memory address space and can be set to a combination of the following literal values: CLK_LOCAL_MEM_FENCE CLK_GLOBAL_MEM_FENCE.

The flags argument specifies the memory address space and can be set to to a combination of the following literal values: CLK_LOCAL_MEM_FENCE CLK_GLOBAL_MEM_FENCE.

The async copy is performed by all work-items in a workgroup and this built-in function must therefore be encountered by all work-items in a workgroup executing the kernel with the same argument values; otherwise the results are undefined. Returns an event object that can be used by wait_group_events to wait for the async copy to finish. The event argument can also be used to associate the async_work_group_copy with a previous async copy allowing an event to be shared by multiple async copies; otherwise event should be zero. If event argument is non-zero, the event object supplied in event argument will be returned. This function does not perform any implicit synchronization of source data such as using a barrier before performing the copy.

The src_stride is the stride in elements for each gentype element read from src. The dst_stride is the stride in elements for each gentype element written to dst. The async gather is performed by all work-items in a work-group. This built-in function must therefore be encountered by all work-items in a work-group executing the kernel with the same argument values; otherwise the results are undefined. Returns an event object that can be used by wait_group_events to wait for the async copy to finish. The event argument can also be used to associate the async_work_group_strided_copy with a previous async copy allowing an event to be shared by multiple async copies; otherwise event should be zero. If event argument is non-zero, the event object supplied in event argument will be returned. This function does not perform any implicit synchronization of source data such as using a barrier before performing the copy.

The event objects specified in event_list will be released after the wait is performed. This function must be encountered by all workitems in a work-group executing the kernel with the same num_events and event objects specified in event_list; otherwise the results are undefined.

The prefetch instruction is applied to a work-item in a workgroup and does not affect the functional behavior of the kernel.

Compute (old + val) and store result at location pointed by p. The function returns old.

Compute (old - val) and store result at location pointed by p. The function returns old.

Returns old value.

Compute (old + 1) and store result at location pointed by p. The function returns old.

Compute (old - 1) and store result at location pointed by p. The function returns old.

Compute (old == cmp) ? val : old and store result at location pointed by p. The function returns old.

Compute min(old, val) and store minimum value at location pointed by p. The function returns old.

Compute max(old, val) and store maximum value at location pointed by p. The function returns old.

Compute (old & val) and store result at location pointed by p. The function returns old.

Compute (old | val) and store result at location pointed by p. The function returns old.

Compute (old ^ val) and store result at location pointed by p. The function returns old.

The size of each element in the mask must match the size of each element in the result. For shuffle, only the ilogb(2m-1) least significant bits of each mask element are considered. For shuffle2, only the ilogb(2m-1)+1 least significant bits of each mask element are considered. Other bits in the mask shall be ignored. The elements of the input vectors are numbered from left to right across one or both of the vectors. For this purpose, the number of elements in a vector is given by vec_step(gentypem). The shuffle mask operand specifies, for each element of the result vector, which element of the one or two input vectors the result element gets. Examples: uint4 mask = (uint4)(3, 2, 1, 0); float4 a; float4 r = shuffle(a, mask); // r.s0123 = a.wzyx uint8 mask = (uint8)(0, 1, 2, 3, 4, 5, 6, 7); float4 a, b; float8 r = shuffle2(a, b, mask); // r.s0123 = a.xyzw // r.s4567 = b.xyzw uint4 mask; float8 a; float4 b; b = shuffle(a, mask); Examples that are not valid are: uint8 mask; short16 a; short8 b; b = shuffle(a, mask); <- not valid

read_imagei and read_imageui return unnormalized signed integer and unsigned integer values respectively. Each channel will be stored in a 32-bit integer. read_imagei can only be used with image objects created with image_channel_data_type set to one of the following values: CL_SIGNED_INT8, CL_SIGNED_INT16 and CL_SIGNED_INT32. If the image_channel_data_type is not one of the above values, the values returned by read_imagei are undefined. read_imageui can only be used with image objects created with image_channel_data_type set to one of the following values: CL_UNSIGNED_INT8, CL_UNSIGNED_INT16 and CL_UNSIGNED_INT32. If the image_channel_data_type is not one of the above values, the values returned by read_imageui are undefined. The read_image{i|ui} calls support a nearest filter only. The filter_mode specified in sampler must be set to CLK_FILTER_NEAREST; otherwise the values returned are undefined. Furthermore, the read_image{i|ui} calls that take integer coordinates must use a sampler with normalized coordinates set to CLK_NORMALIZED_COORDS_FALSE and addressing mode set to CLK_ADDRESS_CLAMP_TO_EDGE, CLK_ADDRESS_CLAMP or CLK_ADDRESS_NONE; otherwise the values returned are undefined.

Appropriate data format conversion to the specified image format is done before writing the color value. x & y are considered to be unnormalized coordinates and must be in the range 0 ... image width - 1, and 0 ... image height - 1. write_imagef can only be used with image objects created with image_channel_data_type set to one of the pre-defined packed formats or set to CL_SNORM_INT8, CL_UNORM_INT8, CL_SNORM_INT16, CL_UNORM_INT16, CL_HALF_FLOAT or CL_FLOAT. Appropriate data format conversion will be done to convert channel data from a floating-point value to actual data format in which the channels are stored. write_imagei can only be used with image objects created with image_channel_data_type set to one of the following values: CL_SIGNED_INT8, CL_SIGNED_INT16 and CL_SIGNED_INT32. write_imageui can only be used with image objects created with image_channel_data_type set to one of the following values: CL_UNSIGNED_INT8, CL_UNSIGNED_INT16 and CL_UNSIGNED_INT32. The behavior of write_imagef, write_imagei and write_imageui for image objects created with image_channel_data_type values not specified in the description above or with (x, y) coordinate values that are not in the range (0 ... image width - 1, 0 ... image height - 1), respectively, is undefined.

coord.w is ignored. read_imagef returns floating-point values in the range [0.0 ... 1.0] for image objects created with image_channel_data_type set to one of the predefined packed formats or CL_UNORM_INT8, or CL_UNORM_INT16. read_imagef returns floating-point values in the range [-1.0 ... 1.0] for image objects created with image_channel_data_type set to CL_SNORM_INT8, or CL_SNORM_INT16. read_imagef returns floating-point values for image objects created with image_channel_data_type set to CL_HALF_FLOAT or CL_FLOAT. The read_imagef calls that take integer coordinates must use a sampler with filter mode set to CLK_FILTER_NEAREST, normalized coordinates set to CLK_NORMALIZED_COORDS_FALSE and addressing mode set to CLK_ADDRESS_CLAMP_TO_EDGE, CLK_ADDRESS_CLAMP or CLK_ADDRESS_NONE; otherwise the values returned are undefined. Values returned by read_imagef for image objects with image_channel_data_type values not specified in the description are undefined.

coord.w is ignored. read_imagei and read_imageui return unnormalized signed integer and unsigned integer values respectively. Each channel will be stored in a 32-bit integer. read_imagei can only be used with image objects created with image_channel_data_type set to one of the following values: CL_SIGNED_INT8, CL_SIGNED_INT16 and CL_SIGNED_INT32. If the image_channel_data_type is not one of the above values, the values returned by read_imagei are undefined. read_imageui can only be used with image objects created with image_channel_data_type set to one of the following values: CL_UNSIGNED_INT8, CL_UNSIGNED_INT16 and CL_UNSIGNED_INT32. If the image_channel_data_type is not one of the above values, the values returned by read_imageui are undefined. The read_image{i|ui} calls support a nearest filter only. The filter_mode specified in sampler must be set to CLK_FILTER_NEAREST; otherwise the values returned are undefined. Furthermore, the read_image{i|ui} calls that take integer coordinates must use a sampler with normalized coordinates set to CLK_NORMALIZED_COORDS_FALSE and addressing mode set to CLK_ADDRESS_CLAMP_TO_EDGE, CLK_ADDRESS_CLAMP or CLK_ADDRESS_NONE; otherwise the values returned are undefined.

Valid values are: CLK_A CLK_R CLK_Rx CLK_RG CLK_RGx CLK_RA CLK_RGB CLK_RGBx CLK_RGBA CLK_ARGB CLK_BGRA CLK_INTENSITY CLK_LUMINANCE

The width is returned in the x component, and the height in the y component.

The width is returned in the x component, height in the y component, depth in the z component and the w component is 0.

13.83.3.2 printf()

```
int printf (
             __constant const char * st,
              ... )
```

05742 // Synchronization functions
05743
05744 /**
05745 * All work-items in a work-group executing the kernel
05746 * on a processor must execute this function before any
05747 * are allowed to continue execution beyond the barrier.
05748 * This function must be encountered by all work-items in
05749 * a work-group executing the kernel.
05750 * If barrier is inside a conditional statement, then all
05751 * work-items must enter the conditional if any work-item
05752 * enters the conditional statement and executes the
05753 * barrier.
05754 * If barrer is inside a loop, all work-items must execute
05755 * the barrier for each iteration of the loop before any are
05756 * allowed to continue execution beyond the barrier.
05757 * The barrier function also queues a memory fence
05758 * (reads and writes) to ensure correct ordering of
05759 * memory operations to local or global memory.
05760 * The flags argument specifies the memory address space
05761 * and can be set to a combination of the following literal
05762 * values.
05763 * CLK_LOCAL_MEM_FENCE - The barrier function
05764 * will either flush any variables stored in local memory
05765 * or queue a memory fence to ensure correct ordering of
05766 * memory operations to local memory.
05767 * CLK_GLOBAL_MEM_FENCE - The barrier function
05768 * will queue a memory fence to ensure correct ordering
05769 * of memory operations to global memory.  This can be
05770 * useful when work-items, for example, write to buffer or
05771 * image objects and then want to read the updated data.

05993
05994 /**
05995 * Perform an async gather of num_elements
05996 * gentype elements from src to dst.  The
05997 * src_stride is the stride in elements for each
05998 * gentype element read from src.  The dst_stride
05999 * is the stride in elements for each gentype
06000 * element written to dst.  The async gather is
06001 * performed by all work-items in a work-group.
06002 * This built-in function must therefore be
06003 * encountered by all work-items in a work-group
06004 * executing the kernel with the same argument
06005 * values; otherwise the results are undefined.
06006 * Returns an event object that can be used by
06007 * wait_group_events to wait for the async copy
06008 * to finish.  The event argument can also be used
```

```
06009 * to associate the
06010 * async_work_group_strided_copy with a
06011 * previous async copy allowing an event to be
06012 * shared by multiple async copies; otherwise event
06013 * should be zero.
06014 * If event argument is non-zero, the event object
06015 * supplied in event argument will be returned.
06016 * This function does not perform any implicit
06017 * synchronization of source data such as using a
06018 * barrier before performing the copy.
06019 */

06490
06491 // Miscellaneous vector functions
06492
06493 /**
06494 * The shuffle and shuffle2 built-in functions construct
06495 * a permutation of elements from one or two input
06496 * vectors respectively that are of the same type,
06497 * returning a vector with the same element type as the
06498 * input and length that is the same as the shuffle mask.
06499 * The size of each element in the mask must match the
06500 * size of each element in the result.  For shuffle, only
06501 * the ilogb(2m-1) least significant bits of each mask
06502 * element are considered.  For shuffle2, only the
06503 * ilogb(2m-1)+1 least significant bits of each mask
06504 * element are considered.  Other bits in the mask shall
06505 * be ignored.
06506 * The elements of the input vectors are numbered from
06507 * left to right across one or both of the vectors.  For this
06508 * purpose, the number of elements in a vector is given
06509 * by vec_step(gentypem).  The shuffle mask operand
06510 * specifies, for each element of the result vector, which
06511 * element of the one or two input vectors the result
06512 * element gets.
06513 * Examples:
06514 * uint4 mask = (uint4)(3, 2,
06515 * 1, 0);
06516 * float4 a;
06517 * float4 r = shuffle(a, mask);
06518 * // r.s0123 = a.wzyx
06519 * uint8 mask = (uint8)(0, 1, 2, 3,
06520 * 4, 5, 6, 7);
06521 * float4 a, b;
06522 * float8 r = shuffle2(a, b, mask);
06523 * // r.s0123 = a.xyzw

13.85.1 Detailed Description

Adds helper functions to populate Id's and Range's with OpenCL SPIR intrinsics data: e.g.

get_global_id(0)

Todo implement group and nd_item and to add nd_item to create_parallel_for_arg

```

Returns the unique local work-item ID i.e.

get_global_offset returns the offset values specified in global_work_offset argument to clEnqueueNDRangeKernel.

get_group_id returns the work-group ID which is a number from 0 .

Returns the number of work-groups that will execute a kernel for dimension identified by dimindx.

Returns the number of local work-items specified in dimension identified by dimindx.

Returns the number of global work-items specified for dimension identified by dimindx.

Returns the unique global work-item ID value for dimension identified by dimindx.

a work-item within a specific work-group for dimension identified by dimindx. Valid values of dimindx are 0 to get_work_dim() – 1. For other values of dimindx, get_local_id() returns 0. For clEnqueueTask, this returns 0.

The global work-item ID specifies the work-item ID based on the number of global work-items specified to execute the kernel. Valid values of dimindx are 0 to get_work_dim() – 1. For other values of dimindx, get_global_id() returns 0. For clEnqueueTask, this returns 0.

This value is given by the global_work_size argument to clEnqueueNDRangeKernel. Valid values of dimindx are 0 to get_work_dim() – 1. For other values of dimindx, get_global_size() returns 1. For clEnqueueTask, this always returns 1.

This value is given by the local_work_size argument to clEnqueueNDRangeKernel if local_work_size is not NULL; otherwise the OpenCL implementation chooses an appropriate local_work_size value which is returned by this function. Valid values of dimindx are 0 to get_work_dim() – 1. For other values of dimindx, get_local_size() returns 1. For clEnqueueTask, this always returns 1.

Valid values of dimindx are 0 to get_work_dim() – 1. For other values of dimindx, get_num_groups () returns 1. For clEnqueueTask, this always returns 1.

. get_num_groups(dimindx) – 1. Valid values of dimindx are 0 to get_work_dim() – 1. For other values, get_group↩
_id() returns 0. For clEnqueueTask, this returns 0.

Valid values of dimindx are 0 to get_work_dim() – 1. For other values, get_global_offset() returns 0. For cl↩
EnqueueTask, this returns 0.

Write color value to location specified by coord.xy in the 2D image layer identified by index coord.z in the 2D image array.

Use coord.xy to do an element lookup in the 2D image layer identified by index coord.z in the 2D image array.

Return the number of images in the 1D image array.

Return the number of images in the 2D image array.

Return the 3D image width, height, and depth as an int4 type.

Return the 2D image width and height as an int2 type.

Return the image channel order.

Return the image depth in pixels.

Return the image height in pixels.

Return the image width in pixels.

Write color value to location specified by coordinate (x, y, z) in the 3D image object specified by image.

Use the coordinate (coord.x, coord.y, coord.z) to do an element lookup in the 3D image object specified by image.

Write color value to location specified by coordinate (x, y) in the 2D image object specified by image.

Use the coordinate (x, y) to do an element lookup in the 2D image object specified by image.

The shuffle and shuffle2 built-in functions construct a permutation of elements from one or two input vectors respectively that are of the same type, returning a vector with the same element type as the input and length that is the same as the shuffle mask.

Swaps the old value stored at location p with new value given by val.

unsigned int atomic_sub (volatile __global unsigned int *p, unsigned int val) int atomic_sub (volatile __local int *p, int val) unsigned int atomic_sub (volatile __local unsigned int *p, unsigned int val) Read the 32-bit value (referred to as old) stored at location pointed by p.

Read the 32-bit value (referred to as old) stored at location pointed by p.

Prefetch num_elements * sizeof(gentype) bytes into the global cache.

Wait for events that identify the async_work_group_copy operations to complete.

Perform an async gather of num_elements gentype elements from src to dst.

event_t async_work_group_copy (__global gentype *dst, const __local gentype *src, size_t num_elements, event_t event) Perform an async copy of num_elements gentype elements from src to dst.

Write memory barrier that orders only stores.

Read memory barrier that orders only loads.

Orders loads and stores of a work-item executing a kernel.

For n = 1, 2, 4, 8 and 16 read sizeof (halfn) bytes of data from address (p + (offset * n)).

The floatn value given by data is converted to a halfn value using the appropriate rounding mode.

The float value given by data is first converted to a half value using the appropriate rounding mode.

Read sizeof (halfn) bytes of data from address (p + (offset * n)).

Read sizeof (half) bytes of data from address (p + offset).

Write sizeof (gentypen) bytes given by data to address (p + (offset * n)).

Return sizeof (gentypen) bytes of data read from address (p + (offset * n)).

For each component of a vector type, result[i] = if MSB of c[i] is set ? b[i] : a[i].

Each bit of the result is the corresponding bit of a if the corresponding bit of c is 0.

Returns 1 if the most significant bit in all components of x is set; otherwise returns 0.

Returns 1 if the most significant bit in any component of x is set; otherwise returns 0.

Test for sign bit.

Test if arguments are unordered.

Test if arguments are ordered.

Test for a normal value.

Test for a NaN.

Test for infinity value (+ve or –ve) .

Test for finite value.

Returns the component-wise compare of (x < y) || (x > y) .

Returns the component-wise compare of x <= y.

Returns the component-wise compare of x < y.

Returns the component-wise compare of x >= y.

Returns the component-wise compare of x > y.

Returns the component-wise compare of x != y.

intn isequal (floatn x, floatn y) Returns the component-wise compare of x == y.

Returns the length of vector p computed as: half_sqrt(p.x2 + p.y2 + ...)

Returns fast_length(p0 – p1).

Returns a vector in the same direction as p but with a length of 1.

Return the length of vector p, i.e., sqrt(p.x2 + p.y 2 + ...)

Returns the distance between p0 and p1.

Compute dot product.

Returns the cross product of p0.xyz and p1.xyz.

Returns 1.0 if x > 0, -0.0 if x = -0.0, +0.0 if x = +0.0, or –1.0 if x < 0.

Returns 0.0 if x <= edge0 and 1.0 if x >= edge1 and performs smooth Hermite interpolation between 0 and 1when edge0 < x < edge1.

Returns 0.0 if x < edge, otherwise it returns 1.0.

Converts degrees to radians, i.e.

Returns the linear blend of x & y implemented as: x + (y – x) ∗ a a must be a value in the range 0.0 . . . 1.0.

Converts radians to degrees, i.e.

Returns fmin(fmax(x, minval), maxval).

Multiply two 24-bit integer values x and y.

Multiply two 24-bit integer values x and y and add the 32-bit integer result to the 32-bit integer z.

result[i] = ((long)hi[i] << 32) | lo[i] result[i] = ((ulong)hi[i] << 32) | lo[i]

result[i] = ((int)hi[i] << 16) | lo[i] result[i] = ((uint)hi[i] << 16) | lo[i]

result[i] = ((short)hi[i] << 8) | lo[i] result[i] = ((ushort)hi[i] << 8) | lo[i]

Returns x - y and saturates the result.

For each element in v, the bits are shifted left by the number of bits given by the corresponding element in i (subject to usual shift modulo rules described in section 6.3).

Computes x * y and returns the high half of the product of x and y.

Returns a * b + c and saturates the result.

Returns mul_hi(a, b) + c.

Returns the number of leading 0-bits in x, starting at the most significant bit position.

Returns min(max(x, minval), maxval).

Returns (x + y + 1) >> 1.

Returns (x + y) >> 1.

Returns x + y and saturates the result.

Returns | x – y | without modulo overflow.

Returns | x |.

Compute tangent over an implementation-defined range.

Compute square root over an implementation-defined range.

Compute sine over an implementation-defined range.

Compute inverse square root over an implementationdefined range.

Compute reciprocal over an implementation-defined range.

Compute a base 10 logarithm over an implementationdefined range.

Compute a base 2 logarithm over an implementationdefined range.

Compute natural logarithm over an implementationdefined range.

Compute the base- 10 exponential of x over an implementation-defined range.

Compute the base- 2 exponential of x over an implementation-defined range.

Compute the base- e exponential of x over an implementation-defined range.

Compute x / y over an implementation-defined range.

Compute cosine over an implementation-defined range.

Compute reciprocal.

Compute the base- 10 exponential of x.

Compute the base- 2 exponential of x.

Compute x / y.

Round to integral value using the round to zero rounding mode.

Compute the gamma function.

Compute tan (PI $*$ x).

Compute hyperbolic tangent.

Compute tangent.

Compute square root.

Compute sin (PI $*$ x).

Compute hyperbolic sine.

Compute sine and cosine of x.

Compute sine.

Compute inverse square root.

Return the integral value nearest to x rounding halfway cases away from zero, regardless of the current rounding direction.

Compute x to the power 1/y.

Round to integral value (using round to nearest even rounding mode) in floating-point format.

The remquo function computes the value r such that r = x - n$*$y, where n is the integer nearest the exact value of x/y.

Compute the value r such that r = x - n$*$y, where n is the integer nearest the exact value of x/y.

Compute x to the power y, where x is $>=$ 0.

Compute x to the power y, where y is an integer.

Compute x to the power y.

Computes the next representable single-precision floating-point value following x in the direction of y.

Returns a quiet NaN.

Decompose a floating-point number.

Returns x if $|$ x $|$ $<$ $|$ y $|$, y if $|$ y $|$ $<$ $|$ x $|$, otherwise fmin(x, y).

Returns x if $|$ x $|$ $>$ $|$ y $|$, y if $|$ y $|$ $>$ $|$ x $|$, otherwise fmax(x, y).

mad approximates a $*$ b + c.

Compute the exponent of x, which is the integral part of logr $|$ x $|$.

Compute a base e logarithm of (1.0 + x).

Compute a base 10 logarithm.

Compute a base 2 logarithm.

Compute natural logarithm.

Log gamma function.

Multiply x by 2 to the power n.

Return the exponent as an integer value.

Compute the value of the square root of x^2+ y^2 without undue overflow or underflow.

Extract mantissa and exponent from x.

Returns fmin(x – floor (x), 0x1.fffffep-1f).

Modulus.

Returns y if y $<$ x, otherwise it returns x.

Returns y if x $<$ y, otherwise it returns x.

Returns the correctly rounded floating-point representation of the sum of c with the infinitely precise product of a and b.

Round to integral value using the round to –ve infinity rounding mode.

x - y if x $>$ y, +0 if x is less than or equal to y.

Compute absolute value of a floating-point number.

Compute e^x- 1.0.

Exponential base 10 function.

Exponential base 2 function.

Compute the base- e exponential of x.

Error function encountered in integrating the normal distribution.

Complementary error function.

Compute cos (PI $*$ x).

Compute hyperbolic consine.

Compute cosine.

Returns x with its sign changed to match the sign of y.

Round to integral value using the round to +ve infinity rounding mode.

Compute cube-root.

Compute atan2 (y, x) / PI.

Compute atan (x) / PI.

Hyperbolic arc tangent.

Arc tangent of y / x.

Arc tangent function.

Compute asin (x) / PI.

Inverse hyperbolic sine.

Arc sine function.

Compute acos (x) / PI.

Inverse hyperbolic cosine.

Arc cosine function.

get_global_offset returns the offset values specified in global_work_offset argument to clEnqueueNDRangeKernel.

get_group_id returns the work-group ID which is a number from 0 .

Returns the number of work-groups that will execute a kernel for dimension identified by dimindx.

Returns the unique local work-item ID i.e.

Returns the number of local work-items specified in dimension identified by dimindx.

Returns the unique global work-item ID value for dimension identified by dimindx.

Returns the number of global work-items specified for dimension identified by dimindx.

This is the value given to the work_dim argument specified in clEnqueueNDRangeKernel. For clEnqueueTask, this returns 1.

This value is given by the global_work_size argument to clEnqueueNDRangeKernel. Valid values of dimindx are 0 to get_work_dim() – 1. For other values of dimindx, get_global_size() returns 1. For clEnqueueTask, this always returns 1.

The global work-item ID specifies the work-item ID based on the number of global work-items specified to execute the kernel. Valid values of dimindx are 0 to get_work_dim() – 1. For other values of dimindx, get_global_id() returns 0. For clEnqueueTask, this returns 0.

This value is given by the local_work_size argument to clEnqueueNDRangeKernel if local_work_size is not NULL; otherwise the OpenCL implementation chooses an appropriate local_work_size value which is returned by this function. Valid values of dimindx are 0 to get_work_dim() – 1. For other values of dimindx, get_local_size() returns 1. For clEnqueueTask, this always returns 1.

a work-item within a specific work-group for dimension identified by dimindx. Valid values of dimindx are 0 to get_work_dim() – 1. For other values of dimindx, get_local_id() returns 0. For clEnqueueTask, this returns 0.

Valid values of dimindx are 0 to get_work_dim() – 1. For other values of dimindx, get_num_groups () returns 1. For clEnqueueTask, this always returns 1.

. get_num_groups(dimindx) – 1. Valid values of dimindx are 0 to get_work_dim() – 1. For other values, get_group↩
_id() returns 0. For clEnqueueTask, this returns 0.

Valid values of dimindx are 0 to get_work_dim() – 1. For other values, get_global_offset() returns 0. For cl↩ EnqueueTask, this returns 0.

Rounding of intermediate products shall not occur. Edge case behavior is per the IEEE 754-2008 standard.

If one argument is a NaN, fmax() returns the other argument. If both arguments are NaNs, fmax() returns a NaN.

If one argument is a NaN, fmin() returns the other argument. If both arguments are NaNs, fmin() returns a NaN.

Returns x – y ∗ trunc (x/y).

floor(x) is returned in iptr.

For each component the mantissa returned is a float with magnitude in the interval [1/2, 1) or 0. Each component of x equals mantissa returned ∗ 2^exp.

Returns the natural logarithm of the absolute value of the gamma function. The sign of the gamma function is returned in the signp argument of lgamma_r.

Whether or how the product of a ∗ b is rounded and how supernormal or subnormal intermediate products are handled is not defined. mad is intended to be used where speed is preferred over accuracy.

The modf function breaks the argument x into integral and fractional parts, each of which has the same sign as the argument. It stores the integral part in the object pointed to by iptr.

The nancode may be placed in the significand of the resulting NaN.

Thus, if y is less than x, nextafter() returns the largest representable floating-point number less than x.

If there are two integers closest to x/y, n shall be the even one. If r is zero, it is given the same sign as x.

If there are two integers closest to x/y, n shall be the even one. If r is zero, it is given the same sign as x. This is the same value that is returned by the remainder function. remquo also calculates the lower seven bits of the integral quotient x/y, and gives that value the same sign as x/y. It stores this signed value in the object pointed to by quo.

Refer to section 7.1 for description of rounding modes.

The computed sine is the return value and computed cosine is returned in cosval.

x must be in the range -2^16 ... +2^16.

x must be in the range -2^16 . . . +2^16.

x must be in the range -216 . . . +216.

The maximum error is implementation-defined.

The maximum error is implementation defined.

The maximum error is implementationdefined.

The range of x and y are implementation-defined. The maximum error is implementation-defined.

The intermediate sum does not modulo overflow.

Results are undefined if minval > maxval.

Bits shifted off the left side of the element are shifted back in from the right.

Refer to definition of mul24 to see how the 24-bit integer multiplication is performed.

x and y are 32-bit integers but only the low 24-bits are used to perform the multiplication. mul24 should only be used when values in x and y are in the range [- 2^23, 2^23-1] if x and y are signed integers and in the range [0, 2^24-1] if x and y are unsigned integers. If x and y are not in this range, the multiplication result is implementation-defined.

(180 / PI) ∗ radians.

If x and y are infinite or NaN, the return values are undefined.

If a is not in the range 0.0 ... 1.0, the return values are undefined.

(PI / 180) ∗ degrees.

This is useful in cases where you would want a threshold function with a smooth transition. This is equivalent to: gentype t; t = clamp ((x – edge0) / (edge1 – edge0), 0, 1); return t ∗ t ∗ (3 – 2 ∗ t); Results are undefined if edge0 >= edge1 or if x, edge0 or edge1 is a NaN.

Returns 0.0 if x is a NaN.

The w component of float4 result returned will be 0.0.

This is calculated as length(p0 – p1).

fast_normalize is computed as: p ∗ half_rsqrt (p.x^2 + p.y^2 + ...) The result shall be within 8192 ulps error from the infinitely precise result of if (all(p == 0.0f)) result = p; else result = p / sqrt (p.x^2 + p.y^2 + ...); with the following exceptions: 1) If the sum of squares is greater than FLT_MAX then the value of the floating-point values in the result vector are undefined. 2) If the sum of squares is less than FLT_MIN then the implementation may return back p. 3) If the device is in “denorms are flushed to zero” mode, individual operand elements with magnitude less than sqrt(FLT_MIN) may be flushed to zero before proceeding with the calculation.

isordered() takes arguments x and y, and returns the result isequal(x, x) && isequal(y, y).

isunordered() takes arguments x and y, returning non-zero if x or y is NaN, and zero otherwise.

The scalar version of the function returns a 1 if the sign bit in the float is set else returns 0. The vector version of the function returns the following for each component in floatn: a -1 if the sign bit in the float is set else returns 0.

Otherwise it is the corresponding bit of b.

For a scalar type, result = c ? b : a.

The address computed as (p + (offset ∗ n)) must be 8-bit aligned if gentype is char, uchar; 16-bit aligned if gentype is short, ushort; 32-bit aligned if gentype is int, uint, float; 64-bit aligned if gentype is long, ulong.

The data read is interpreted as a half value. The half value is converted to a float value and the float value is returned. The read address computed as (p + offset) must be 16-bit aligned.

The data read is interpreted as a halfn value. The halfn value read is converted to a floatn value and the floatn value is returned. The read address computed as (p + (offset ∗ n)) must be 16-bit aligned.

The half value is then written to address computed as (p + offset). The address computed as (p + offset) must be 16- bit aligned. vstore_half use the current rounding mode. The default current rounding mode is round to nearest even.

The halfn value is then written to address computed as (p + (offset ∗ n)). The address computed as (p + (offset ∗ n)) must be 16-bit aligned. vstore_halfn uses the current rounding mode. The default current rounding mode is round to nearest even.

The data read is interpreted as a halfn value. The halfn value read is converted to a floatn value and the floatn value is returned. The address computed as (p + (offset ∗ n)) must be aligned to sizeof (halfn) bytes. For n = 3, vloada_half3 reads a half3 from address (p + (offset ∗ 4)) and returns a float3. The address computed as (p + (offset ∗ 4)) must be aligned to sizeof (half) ∗ 4 bytes.

For n = 1, 2, 4, 8 and 16, the halfn value is written to the address computed as (p + (offset

- n)). The address computed as (p + (offset ∗ n)) must be aligned to sizeof (halfn) bytes. For n = 3, the half3 value is written to the address computed as (p + (offset ∗ 4)). The address computed as (p + (offset ∗ 4)) must be aligned to sizeof (half) ∗ 4 bytes. vstorea_halfn uses the current rounding mode. The default current rounding mode is round to nearest even.

  This means that loads and stores preceding the mem_fence will be committed to memory before any loads and stores following the mem_fence. The flags argument specifies the memory address space and can be set to a combination of the following literal values: CLK_LOCAL_MEM_FENCE CLK_GLOBAL_MEM_FENCE.

The flags argument specifies the memory address space and can be set to to a combination of the following literal values: CLK_LOCAL_MEM_FENCE CLK_GLOBAL_MEM_FENCE.

The async copy is performed by all work-items in a workgroup and this built-in function must therefore be encountered by all work-items in a workgroup executing the kernel with the same argument values; otherwise the results are undefined. Returns an event object that can be used by wait_group_events to wait for the async copy to finish. The event argument can also be used to associate the async_work_group_copy with a previous async copy allowing an event to be shared by multiple async copies; otherwise event should be zero. If event argument is non-zero, the event object supplied in event argument will be returned. This function does not perform any implicit synchronization of source data such as using a barrier before performing the copy.

The src_stride is the stride in elements for each gentype element read from src. The dst_stride is the stride in elements for each gentype element written to dst. The async gather is performed by all work-items in a work-group. This built-in function must therefore be encountered by all work-items in a work-group executing the kernel with the same argument values; otherwise the results are undefined. Returns an event object that can be used by wait_group_events to wait for the async copy to finish. The event argument can also be used to associate the async_work_group_strided_copy with a previous async copy allowing an event to be shared by multiple async copies; otherwise event should be zero. If event argument is non-zero, the event object supplied in event argument will be returned. This function does not perform any implicit synchronization of source data such as using a barrier before performing the copy.

The event objects specified in event_list will be released after the wait is performed. This function must be encountered by all workitems in a work-group executing the kernel with the same num_events and event objects specified in event_list; otherwise the results are undefined.

The prefetch instruction is applied to a work-item in a workgroup and does not affect the functional behavior of the kernel.

Compute (old + val) and store result at location pointed by p. The function returns old.

Compute (old - val) and store result at location pointed by p. The function returns old.

Returns old value.

Compute (old + 1) and store result at location pointed by p. The function returns old.

Compute (old - 1) and store result at location pointed by p. The function returns old.

Compute (old == cmp) ? val : old and store result at location pointed by p. The function returns old.

Compute min(old, val) and store minimum value at location pointed by p. The function returns old.

Compute max(old, val) and store maximum value at location pointed by p. The function returns old.

Compute (old & val) and store result at location pointed by p. The function returns old.

Compute (old | val) and store result at location pointed by p. The function returns old.

Compute (old ^ val) and store result at location pointed by p. The function returns old.

The size of each element in the mask must match the size of each element in the result. For shuffle, only the ilogb(2m-1) least significant bits of each mask element are considered. For shuffle2, only the ilogb(2m-1)+1 least significant bits of each mask element are considered. Other bits in the mask shall be ignored. The elements of the input vectors are numbered from left to right across one or both of the vectors. For this purpose, the number of elements in a vector is given by vec_step(gentypem). The shuffle mask operand specifies, for each element of the result vector, which element of the one or two input vectors the result element gets. Examples: uint4 mask = (uint4)(3, 2, 1, 0); float4 a; float4 r = shuffle(a, mask); // r.s0123 = a.wzyx uint8 mask = (uint8)(0, 1, 2, 3, 4, 5, 6, 7); float4 a, b; float8 r = shuffle2(a, b, mask); // r.s0123 = a.xyzw // r.s4567 = b.xyzw uint4 mask; float8 a; float4 b; b = shuffle(a, mask); Examples that are not valid are: uint8 mask; short16 a; short8 b; b = shuffle(a, mask); <- not valid

read_imagei and read_imageui return unnormalized signed integer and unsigned integer values respectively. Each channel will be stored in a 32-bit integer. read_imagei can only be used with image objects created with image_channel_data_type set to one of the following values: CL_SIGNED_INT8, CL_SIGNED_INT16 and CL_SIGNED_INT32. If the image_channel_data_type is not one of the above values, the values returned by read_imagei are undefined. read_imageui can only be used with image objects created with image_channel_data_type set to one of the following values: CL_UNSIGNED_INT8, CL_UNSIGNED_INT16 and CL_UNSIGNED_INT32. If the image_channel_data_type is not one of the above values, the values returned by read_imageui are undefined. The read_image{i|ui} calls support a nearest filter only. The filter_mode specified in sampler must be set to CLK_FILTER_NEAREST; otherwise the values returned are undefined. Furthermore, the read_image{i|ui} calls that take integer coordinates must use a sampler with normalized coordinates set to CLK_NORMALIZED_COORDS_FALSE and addressing mode set to CLK_ADDRESS_CLAMP_TO_EDGE, CLK_ADDRESS_CLAMP or CLK_ADDRESS_NONE; otherwise the values returned are undefined.

Appropriate data format conversion to the specified image format is done before writing the color value. x & y are considered to be unnormalized coordinates and must be in the range 0 ... image width - 1, and 0 ... image height - 1. write_imagef can only be used with image objects created with image_channel_data_type set to one of the pre-defined packed formats or set to CL_SNORM_INT8, CL_UNORM_INT8, CL_SNORM_INT16, CL_UNORM_INT16, CL_HALF_FLOAT or CL_FLOAT. Appropriate data format conversion will be done to convert channel data from a floating-point value to actual data format in which the channels are stored. write_imagei can only be used with image objects created with image_channel_data_type set to one of the following values: CL_SIGNED_INT8, CL_SIGNED_INT16 and CL_SIGNED_INT32. write_imageui can only be used with image objects created with image_channel_data_type set to one of the following values: CL_UNSIGNED_INT8, CL_UNSIGNED_INT16 and CL_UNSIGNED_INT32. The behavior of write_imagef, write_imagei and write_imageui for image objects created with image_channel_data_type values not specified in the description above or with (x, y) coordinate values that are not in the range (0 ... image width - 1, 0 ... image height - 1), respectively, is undefined.

coord.w is ignored. read_imagef returns floating-point values in the range [0.0 ... 1.0] for image objects created with image_channel_data_type set to one of the predefined packed formats or CL_UNORM_INT8, or CL_UNORM_INT16. read_imagef returns floating-point values in the range [-1.0 ... 1.0] for image objects created with image_channel_data_type set to CL_SNORM_INT8, or CL_SNORM_INT16. read_imagef returns floating-point values for image objects created with image_channel_data_type set to CL_HALF_FLOAT or CL_FLOAT. The read_imagef calls that take integer coordinates must use a sampler with filter mode set to CLK_FILTER_NEAREST, normalized coordinates set to CLK_NORMALIZED_COORDS_FALSE and addressing mode set to CLK_ADDRESS_CLAMP_TO_EDGE, CLK_ADDRESS_CLAMP or CLK_ADDRESS_NONE; otherwise the values returned are undefined. Values returned by read_imagef for image objects with image_channel_data_type values not specified in the description are undefined.

coord.w is ignored. read_imagei and read_imageui return unnormalized signed integer and unsigned integer values respectively. Each channel will be stored in a 32-bit integer. read_imagei can only be used with image objects created with image_channel_data_type set to one of the following values: CL_SIGNED_INT8, CL_SIGNED_INT16 and CL_SIGNED_INT32. If the image_channel_data_type is not one of the above values, the values returned by read_imagei are undefined. read_imageui can only be used with image objects created with image_channel_data_type set to one of the following values: CL_UNSIGNED_INT8, CL_UNSIGNED_INT16 and CL_UNSIGNED_INT32. If the image_channel_data_type is not one of the above values, the values returned by read_imageui are undefined. The read_image{i|ui} calls support a nearest filter only. The filter_mode specified in sampler must be set to CLK_FILTER_NEAREST; otherwise the values returned are undefined. Furthermore, the read_image{i|ui} calls that take integer coordinates must use a sampler with normalized coordinates set to CLK_NORMALIZED_COORDS_FALSE and addressing mode set to CLK_ADDRESS_CLAMP_TO_EDGE, CLK_ADDRESS_CLAMP or CLK_ADDRESS_NONE; otherwise the values returned are undefined.

Valid values are: CLK_A CLK_R CLK_Rx CLK_RG CLK_RGx CLK_RA CLK_RGB CLK_RGBx CLK_RGBA CLK↩
_ARGB CLK_BGRA CLK_INTENSITY CLK_LUMINANCE

The width is returned in the x component, and the height in the y component.

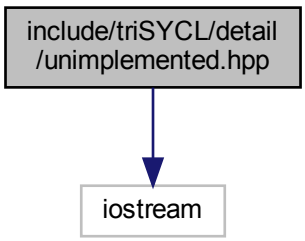
The width is returned in the x component, height in the y component, depth in the z component and the w component is 0.

13.87.2.2 printf()

```
int printf (
              __constant const char * st,
               ... )
```

13.88 opencl_spir_req.h

Go to the documentation of this file.



```
00001 #ifndef TRISYCL_SYCL_DETAIL_SPIR_OPENCL_SPIR_REQ_H
00002 #define TRISYCL_SYCL_DETAIL_SPIR_OPENCL_SPIR_REQ_H
00003
00004 /** \file This file is a temporary work around for integrating OpenCL builtins
00005 and intrinsics into triSYCL, it adds only what is needed from opencl_spir.h
00006 for the .cpp to .ll pre-kernel device compilation step.
00007
00008 This avoids the need to modify the compiler to include types not normally
00009 supported without the OpenCL flags active (half, clk_event_t etc.).
00010
00011 The intrinsics and components from this file are based on the opencl_spir.h
00012 file of the Khronos Group SPIR-Tools repository with some minor
00013 modifications:  https://github.com/KhronosGroup/SPIR-Tools
00014
00015 \todo Rather than have this file to work around OpenCL specific types modify
00016 the Clang/LLVM device compiler to include the OpenCL specific types and
00017 related processing when -sycl is used (or -sycl-is-device?)
00018 \todo OR rather than the above use the sycl specfic CL types in here instead
00019 e.g.  cl::sycl::cl_uint in place of unsigned int.

Include dependency graph for host_device.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class trisycl::detail::host_device

  SYCL host device.

Namespaces

- namespace trisycl

  The vector type to be used as SYCL vector.
- namespace trisycl::detail

  Some global triSYCL configuration.

Macros

- #define TRISYCL_DEFINE_DEVICE_HOST_INFO_TEMPLATE(name, result) case (info::device::name) ↩ : return (result);

  Query the device for OpenCL info::device info.

13.93.1 Macro Definition Documentation

13.93.1.1 TRISYCL_DEFINE_DEVICE_HOST_INFO_TEMPLATE

```
#define TRISYCL_DEFINE_DEVICE_HOST_INFO_TEMPLATE(
              name,
              result )  case (info::device::name) :  return (result);
```

Query the device for OpenCL info::device info.

Return synchronous errors via the SYCL exception class.

Todo To be implemented

Include dependency graph for device_runtime.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class trisycl::drt::accessor< Accessor >

  SYCL accessor seen from a device perspective. *More...*
- struct trisycl::drt::code::program

  A binary program containing some kernels.

Namespaces

- namespace trisycl

  The vector type to be used as SYCL vector.
- namespace trisycl::drt

  The device-side runtime.
- namespace trisycl::drt::code

  The binary code of the kernels.

Functions

- TRISYCL_WEAK_ATTRIB_PREFIX void TRISYCL_WEAK_ATTRIB_SUFFIX trisycl::drt::serialize_arg (detail::task &task, std::size_t index, void ∗arg, std::size_t arg_size)

  Set an argument value of the kernel.
- TRISYCL_WEAK_ATTRIB_PREFIX void TRISYCL_WEAK_ATTRIB_SUFFIX trisycl::drt::serialize_accessor_arg (detail::task &task, std::size_t index, void ∗arg, std::size_t arg_size)

  Set an accessor argument of the kernel.
- TRISYCL_WEAK_ATTRIB_PREFIX void TRISYCL_WEAK_ATTRIB_SUFFIX trisycl::drt::set_kernel (detail↩ ::task &task, const char ∗kernel_name, const char ∗kernel_short_name)

  Set the kernel for a later invocation.

Variables

- TRISYCL_WEAK_ATTRIB_PREFIX std::map< std::string, std::vector< unsigned char > > TRISYCL_WEAK_ATTRIB_SUFFIX trisycl::drt::kernel_IR

  The code of the kernels arranged by name.

```
#include <boost/compute.hpp>
```

Include dependency graph for device_selector_tail.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class trisycl::device_type_selector

  A device selector by device_type. More...
- class trisycl::device_typename_selector< DeviceType >

  Select a device by template device_type parameter. More...

Namespaces

- namespace trisycl

  The vector type to be used as SYCL vector.

Typedefs

- using trisycl::default_selector = device_typename_selector< info::device_type::automatic >

  Devices selected by heuristics of the system.
- using trisycl::gpu_selector = device_typename_selector< info::device_type::gpu >

  Select devices according to device type info::device::device_type::gpu from all the available OpenCL devices.
- using trisycl::cpu_selector = device_typename_selector< info::device_type::cpu >

  Select devices according to device type info::device::device_type::cpu from all the available devices and heuristics.
- using trisycl::host_selector = device_typename_selector< info::device_type::host >

  Selects the SYCL host CPU device that does not require an OpenCL runtime.

13.117 include/triSYCL/exception.hpp File Reference

`#include <exception>`
Include dependency graph for exception.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- struct trisycl::exception_list

  Exception list to store several exceptions. More...
- class trisycl::exception

  Encapsulate a SYCL error information. More...
- class trisycl::cl_exception

  Returns the OpenCL error code encapsulated in the exception. More...
- struct trisycl::async_exception

  An error stored in an exception_list for asynchronous errors. More...

- class trisycl::runtime_error
- class trisycl::kernel_error

  Error that occurred before or while enqueuing the SYCL kernel. More...
- class trisycl::accessor_error

  Error regarding the trisycl::accessor objects defined. More...
- class trisycl::nd_range_error

  Error regarding the trisycl::nd_range specified for the SYCL kernel. More...
- class trisycl::event_error

  Error regarding associated trisycl::event objects. More...
- class trisycl::invalid_parameter_error

  Error regarding parameters to the SYCL kernel, it may apply to any captured parameters to the kernel lambda. More...
- class trisycl::device_error

  The SYCL device will trigger this exception on error. More...
- class trisycl::compile_program_error

  Error while compiling the SYCL kernel to a SYCL device. More...
- class trisycl::link_program_error

  Error while linking the SYCL kernel to a SYCL device. More...
- class trisycl::invalid_object_error

  Error regarding any memory objects being used inside the kernel. More...
- class trisycl::memory_allocation_error

  Error on memory allocation on the SYCL device for a SYCL kernel. More...
- class trisycl::pipe_error

  A failing pipe error will trigger this exception on error. More...
- class trisycl::platform_error

  The SYCL platform will trigger this exception on error. More...
- class trisycl::profiling_error

  The SYCL runtime will trigger this error if there is an error when profiling info is enabled. More...
- class trisycl::feature_not_supported

  Exception thrown when an optional feature or extension is used in a kernel but its not available on the device the SYCL kernel is being enqueued on. More...
- class trisycl::non_cl_error

  Exception for an OpenCL operation requested in a non OpenCL area. More...

Namespaces

- namespace trisycl

  The vector type to be used as SYCL vector.

Typedefs

- using trisycl::exception_ptr = std::exception_ptr

  A shared pointer to an exception as in C++ specification.
- using trisycl::async_handler = function_class< void, exception_list >

13.131 include/triSYCL/info/param_traits.hpp File Reference

This graph shows which files directly or indirectly include this file:

Classes

- struct trisycl::info::param_traits< T, Param >

  Implement a meta-function from (T, value) to T' to express the return type value of an OpenCL function of kind (T, value)

Namespaces

- namespace trisycl

  The vector type to be used as SYCL vector.
- namespace trisycl::info

Macros

- #define TRISYCL_INFO_PARAM_TRAITS_ANY_T(T, RETURN_TYPE)

  To declare a param_traits returning RETURN_TYPE for function of any T.
- #define TRISYCL_INFO_PARAM_TRAITS(VALUE, RETURN_TYPE)

  To declare a param_traits returning RETURN_TYPE for function taking a VALUE of type T.

13.131.1 Macro Definition Documentation

13.131.1.1 TRISYCL_INFO_PARAM_TRAITS

```
#define TRISYCL_INFO_PARAM_TRAITS(
              VALUE,
              RETURN_TYPE )
```

Value:

```
  template <>                                                   \
  struct param_traits<decltype(VALUE), VALUE> {                 \
    using return_type = RETURN_TYPE;                            \
  };
```

To declare a param_traits returning RETURN_TYPE for function taking a VALUE of type T.

Definition at line 34 of file param_traits.hpp.

13.131.1.2 TRISYCL_INFO_PARAM_TRAITS_ANY_T

```
#define TRISYCL_INFO_PARAM_TRAITS_ANY_T(
              T,
              RETURN_TYPE )
```

Value:

```
  template <T Param>                                            \
  struct param_traits<T, Param> {                               \
    using return_type = RETURN_TYPE;                            \
  };
```

To declare a param_traits returning RETURN_TYPE for function of any T.

Definition at line 24 of file param_traits.hpp.

```

Value:

```
  template<typename T>                      \
  /* Just forward the scalar case to the C++ math library */           \
  T FUN(const T& x) {                                                  \
    return std::FUN(x);                                                \
  }                                                                    \
  /* Declare the vector version as applying the scalar version on each  \
element */                                                              \
  template <typename T, int size>                                      \
  auto FUN(const vec<T, size>& x) {                                    \
    return x.map(FUN<T>);                                              \
  }
```

Declare a FUN unary function for scalar and vector types.

Definition at line 30 of file math.hpp.

13.141.2.2 TRISYCL_MATH_WRAP2

```
#define TRISYCL_MATH_WRAP2(
              FUN )
```

Value:

```
  template<typename T>                    \
  /* Just forward the scalar case to the C++ math library */           \
  T FUN(const T& x, const T& y) {                                       \
    return std::FUN(x, y);                                              \
  }                                                                     \
  /* Declare the vector version as applying the scalar version on each  \
element */                                                             \
  template <typename T, int size>                                       \
  auto FUN(const vec<T, size>& x,                                       \
           const vec<T, size>& y) {                                     \
    return x.zip(y, FUN<T,T>);                                          \
  }
```

Declare a FUN binary function for scalar and vector types.

Definition at line 43 of file math.hpp.

13.141.2.3 TRISYCL_MATH_WRAP2s

```
#define TRISYCL_MATH_WRAP2s(
              FUN )
```

Value:

```
  template<typename T, typename U>        \
  /* Just forward the scalar case to the C++ math library */           \
  T FUN(const T& x, const U& y) {                                       \
    return std::FUN(x, y);                                              \
  }                                                                     \
  /* Declare the vector version as applying the scalar version on each  \
element */                                                             \
  template <typename T, typename U, int size>                           \
  auto FUN(const vec<T, size>& x,                                       \
           const U& y) {                                                \
    return x.map([&] (auto e) { return FUN(e, y); });                   \
  }
```

Declare a FUN binary function for scalar and vector types, with 2 different types.

Definition at line 58 of file math.hpp.

13.141.2.4 TRISYCL_MATH_WRAP3

```
#define TRISYCL_MATH_WRAP3(
              FUN )
```

Value:

```
  template<typename T>                    \
  /* Just forward the scalar case to the C++ math library */           \
  T FUN(const T& x, const T& y, const T& z) {                           \
    return std::FUN(x, y, z);                                           \
  }                                                                     \
  /* Declare the vector version as applying the scalar version on each  \
element */                                                             \
  template <typename T, int size>                                       \
  auto FUN(const vec<T, size>& x,                                       \
           const vec<T, size>& y,                                       \
           const vec<T, size>& z) {                                     \
  return x.zip(y, z, FUN<T,T,T>);                                       \
}
```

Declare a FUN ternary function for scalar and vector types.

Definition at line 72 of file math.hpp.

13.141.2.5 TRISYCL_MATH_WRAP3s

```
#define TRISYCL_MATH_WRAP3s(
               FUN )
```

Value:

```
  template<typename T, typename U>       \
  /* Just forward the scalar case to the C++ math library */           \
  T FUN(const T& x, const T& y, const U& z) {                          \
    return std::FUN(x, y, z);                                          \
  }                                                                    \
  /* Declare the vector version as applying the scalar version on each  \
element */                                                             \
  template <typename T, typename U, int size>                          \
  auto FUN(const vec<T, size>& x,                                      \
           const vec<T, size>& y,                                      \
           const U& z) {                                               \
    return x.zip(y, [&] (auto ex, auto ey) { return FUN(ex, ey, z); }); \
}
```

Declare a FUN ternary function for scalar and vector types, with 2 different types, the 2 first arguments have the same type.

Definition at line 88 of file math.hpp.

13.141.2.6 TRISYCL_MATH_WRAP3ss

```
#define TRISYCL_MATH_WRAP3ss(
               FUN )
```

Value:

```
  template<typename T, typename U>      \
  /* Just forward the scalar case to the C++ math library */           \
  T FUN(const T& x, const U& y, const U& z) {                          \
    return std::FUN(x, y, z);                                          \
  }                                                                    \
  /* Declare the vector version as applying the scalar version on each  \
element */                                                             \
  template <typename T, typename U, int size>                          \
  auto FUN(const vec<T, size>& x,                                      \
           const U& y,                                                 \
           const U& z) {                                               \
    return x.map([&] (auto e) { return FUN(e, y, z); });               \
}
```

Declare a FUN ternary function for scalar and vector types, with 2 different types, the 2 last arguments have the same type.

Definition at line 104 of file math.hpp.

13.147.1 Detailed Description

triSYCL wrapper for OpenCL types

Joan DOT Thibault AT ens-rennes DOT fr a.doumoulakis AT gmail DOT com

This file is distributed under the University of Illinois Open Source License. See LICENSE.TXT for details.

Definition in file opencl_types.hpp.

13.147.2 Macro Definition Documentation

13.147.2.1 TRISYCL_BOOST_COMPUTE_NAME

```
#define TRISYCL_BOOST_COMPUTE_NAME(
              scalar,
              size )  TRISYCL_SIZED_NAME(boost::compute::TRISYCL_TYPE_NAME(scalar), size)
```

Definition at line 139 of file opencl_types.hpp.

13.147.2.2 TRISYCL_DECLARE_CL_TYPES

```
#define TRISYCL_DECLARE_CL_TYPES(
              r,
              data,
              scalar )
```

Value:

```
  TRISYCL_DEFINE_TYPES(scalar, 1)                                   \
  TRISYCL_DEFINE_TYPES(scalar, 2)                                   \
  TRISYCL_DEFINE_TYPES(scalar, 3)                                   \
  TRISYCL_DEFINE_TYPES(scalar, 4)                                   \
  TRISYCL_DEFINE_TYPES(scalar, 8)                                   \
  TRISYCL_DEFINE_TYPES(scalar, 16)
```

Definition at line 170 of file opencl_types.hpp.

13.147.2.3 TRISYCL_DEFINE_TYPES

```
#define TRISYCL_DEFINE_TYPES(
              scalar,
              i )
```

Value:

```
  TRISYCL_H_DEFINE_TYPE(TRISYCL_SIZED_NAME(TRISYCL_TYPE_CL_NAME(scalar), i),    \
                        TRISYCL_BOOST_COMPUTE_NAME(scalar, i),                  \
                        TRISYCL_TYPE_ACTUAL_NAME(scalar), i)
```

Definition at line 160 of file opencl_types.hpp.

13.147.2.4 TRISYCL_H_DEFINE_TYPE

```
#define TRISYCL_H_DEFINE_TYPE(
              cl_type,
              boost_name,
              scalar_type,
              i )
```

Value:

```
  BOOST_PP_IF(BOOST_PP_EQUAL(i, 1), TRISYCL_TYPEDEF_TYPE,                    \
              BOOST_PP_IF(BOOST_PP_EQUAL(i, 2), TRISYCL_WRAPPER_CLASS_2,     \
                          BOOST_PP_IF(BOOST_PP_EQUAL(i, 3),                  \
                                      TRISYCL_WRAPPER_CLASS_3,               \
                                      BOOST_PP_IF(BOOST_PP_EQUAL(i, 4),      \
                                                  TRISYCL_WRAPPER_CLASS_4,   \
                                                  TRISYCL_TYPEDEF_TYPE))))   \
  (cl_type, boost_name, scalar_type)
```

Definition at line 149 of file opencl_types.hpp.

13.147.2.5 TRISYCL_IS_WRAPPER_TRAIT

```
#define TRISYCL_IS_WRAPPER_TRAIT(
              type ) template <> struct is_wrapper<type> :  std::true_type {};
```

Definition at line 85 of file opencl_types.hpp.

13.147.2.6 TRISYCL_SCALAR_TYPES

```
#define TRISYCL_SCALAR_TYPES
```

Value:

```
  BOOST_PP_TUPLE_TO_LIST(                                                    \
    10,                                                                      \

Include dependency graph for parallelism.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- struct trisycl::detail::parallel_for_iterate< level, Range, ParallelForFunctor, Id >

  A recursive multi-dimensional iterator that ends up calling f. More...
- struct trisycl::detail::parallel_for_iterate< 0, Range, ParallelForFunctor, Id >

  Stop the recursion when level reaches 0 by simply calling the kernel functor with the constructed id. More...

Namespaces

- namespace trisycl

  The vector type to be used as SYCL vector.
- namespace trisycl::detail

  Some global triSYCL configuration.

Functions

- template<int Dimensions = 1, typename ParallelForFunctor , typename Id >
  void trisycl::detail::parallel_for (range< Dimensions > r, ParallelForFunctor f, Id)

  Implementation of a data parallel computation with parallelism specified at launch time by a range<>.
- template<int Dimensions = 1, typename ParallelForFunctor >
  void trisycl::detail::parallel_for (range< Dimensions > r, ParallelForFunctor f, item< Dimensions >)

  Implementation of a data parallel computation with parallelism specified at launch time by a range<>.
- template<typename F , typename R , typename A >
  auto trisycl::detail::capture_arg_v (R(F::*)(A))
- template<int Dimensions = 1, typename ParallelForFunctor >
  void trisycl::detail::parallel_for (range< Dimensions > r, ParallelForFunctor f)

  Calls the appropriate ternary parallel_for overload based on the index type of the kernel function object f.
- template<int Dimensions = 1, typename ParallelForFunctor >
  void trisycl::detail::parallel_for_global_offset (range< Dimensions > global_size, id< Dimensions > offset, ParallelForFunctor f)

  Implementation of parallel_for with a range<> and an offset.

- template<int Dimensions = 1, typename ParallelForFunctor >
  void trisycl::detail::parallel_for_workgroup (nd_range< Dimensions > r, ParallelForFunctor f)

  Implement the loop on the work-groups.
- template<int Dimensions, typename T_Item , typename ParallelForFunctor >
  void trisycl::detail::parallel_for_workitem (const group< Dimensions > &g, ParallelForFunctor f)

  Implement the loop on the work-items inside a work-group.
- template<int Dimensions = 1, typename ParallelForFunctor >
  void trisycl::detail::parallel_for (nd_range< Dimensions > r, ParallelForFunctor f)

  Implement a variation of parallel_for to take into account a nd_range<>
- template<int Dimensions = 1, typename ParallelForFunctor >
  void trisycl::detail::parallel_for_workitem_in_group (const group< Dimensions > &g, ParallelForFunctor f)

  Implement the loop on the work-items inside a work-group.

13.151.1 Detailed Description

Implement the detail of the parallel constructions to launch kernels.

00180
00181 /* These helpers work specifically for the parallel_for overload:
00182 parallel_for(range<Dimensions> r, ParallelForFunctor f)
00183
00184 They generate a value from the type of the passed in kernels(lambda)
00185 argument (item or id) and pass it onwards to parallel_for.
00186
00187 From the C++ spec I believe lambda's should only require const or no
00188 qualification for the forseeable future (at least by default).  Const in the
00189 case where the mutable keyword has not been used and no const when mutable
00190 has been used.
00191
00192 \todo A future change may be to modify htat to capture_arg_t and alter the
00193 parallel_for call stack to take a type rather than value.
00194 \todo In c++20 these may be redefineable as inline lambda's of the form:
00195 [captures] <tparams> (params) {body}
00196 */
00197 template<typename F, typename R, typename A>
00198 auto capture_arg_v(R(F::*)(A)) { return A{}; }
00199
00200 template<typename F, typename R, typename A>
00201 auto capture_arg_v(R(F::*)(A) const) { return A{}; }
00202
00203 /** Calls the appropriate ternary parallel_for overload based on the
00204 index type of the kernel function object f
00205
00206 capture_arg_v generates a value from the type of the passed in kernels
00207 (lambdas) argument (item or id in this case) and passes it onwards to
00208 parallel_for so that it's aware which index class it's supposed to generate
00209 data for.
```

```
00210
00211 We erase the type then retrieve it again so that we can avoid redefining
00212 the parallel_for interface in handler.hpp for item and id as the
00213 parallel_for in the SYCL 1.2.1 spec that accepts a range can be overloaded
00214 for both.

- template<int Dimensions = 1, typename ParallelForFunctor , typename Id >
  void trisycl::detail::parallel_for (range< Dimensions > r, ParallelForFunctor f, Id)

Implementation of a data parallel computation with parallelism specified at launch time by a range<>.

- template<int Dimensions = 1, typename ParallelForFunctor >
  void trisycl::detail::parallel_for (range< Dimensions > r, ParallelForFunctor f, item< Dimensions >)

  Implementation of a data parallel computation with parallelism specified at launch time by a range<>.
- template<int Dimensions = 1, typename ParallelForFunctor >
  void trisycl::detail::parallel_for (range< Dimensions > r, ParallelForFunctor f)

  Calls the appropriate ternary parallel_for overload based on the index type of the kernel function object f.
- template<int Dimensions = 1, typename ParallelForFunctor >
  void trisycl::detail::parallel_for_global_offset (range< Dimensions > global_size, id< Dimensions > offset, ParallelForFunctor f)

  Implementation of parallel_for with a range<> and an offset.
- template<int Dimensions = 1, typename ParallelForFunctor >
  void trisycl::detail::parallel_for_workgroup (nd_range< Dimensions > r, ParallelForFunctor f)

  Implement the loop on the work-groups.
- template<int Dimensions, typename T_Item , typename ParallelForFunctor >
  void trisycl::detail::parallel_for_workitem (const group< Dimensions > &g, ParallelForFunctor f)

  Implement the loop on the work-items inside a work-group.
- template<int Dimensions = 1, typename ParallelForFunctor >
  void trisycl::detail::parallel_for (nd_range< Dimensions > r, ParallelForFunctor f)

  Implement a variation of parallel_for to take into account a nd_range<>
- template<int Dimensions = 1, typename ParallelForFunctor >
  void trisycl::detail::parallel_for_workitem_in_group (const group< Dimensions > &g, ParallelForFunctor f)

  Implement the loop on the work-items inside a work-group.

13.153.1 Detailed Description

Implement the detail of the parallel constructions to launch kernels using Intel Threading Building Blocks (TBB).

This file gets conditionally included in "trisycl/parallelism.hpp" if TRISYCL_TBB is defined by the preprocessor.

00029
00030 /** A SYCL static-scoped pipe equivalent to an OpenCL program-scoped
00031 pipe
00032
00033 Implement a FIFO-style object that can be used through accessors
00034 to send some objects T from the input to the output.
00035
00036 Compared to a normal pipe, a static_pipe takes a constexpr size
00037 and is expected to be declared in a compile-unit static context so
00038 the compiler can generate everything at compile time.
00039
00040 This is useful to generate a fixed and optimized hardware
00041 implementation on FPGA for example, where the interconnection
00042 graph can be also inferred at compile time.
00043
00044 It is not directly mapped to the OpenCL program-scoped pipe
00045 because in SYCL there is not this concept of separated
00046 program.  But the SYCL device compiler is expected to generate some
00047 OpenCL program(s) with program-scoped pipes when a SYCL
00048 static-scoped pipe is used.  These details are implementation
00049 defined.
