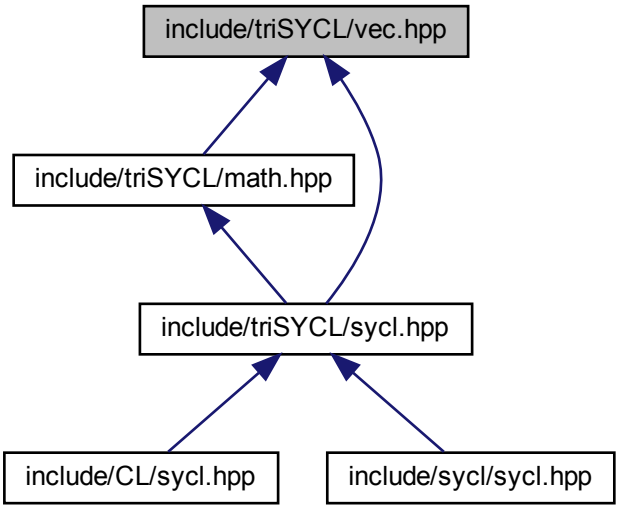
13.191 include/triSYCL/vec.hpp File Reference



Implement the small vector class.

```
#include <tuple>
#include <utility>
#include "triSYCL/rounding_mode.hpp"
#include "triSYCL/detail/alignment_helper.hpp"
#include "triSYCL/vec/detail/vec.hpp"
#include "triSYCL/vec/detail/swiz2.hpp"
#include "triSYCL/vec/detail/swiz3.hpp"
#include "triSYCL/vec/detail/swiz4.hpp"
#include "triSYCL/vec/detail/swiz_rgba.hpp"
```

Include dependency graph for vec.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- struct trisycl::elem

  Series of values to specify named swizzle indexes. More...
- class trisycl::vec< DataType, 1 >
- class trisycl::vec< DataType, 2 >
- class trisycl::vec< DataType, 3 >
- class trisycl::vec< DataType, 4 >
- class trisycl::vec< DataType, 8 >
- class trisycl::vec< DataType, 16 >
- struct std::tuple_element< I, trisycl::vec< T, Size > >

  The std::tuple_element specialization for vec.
- struct std::tuple_size< trisycl::vec< T, Size > >

  The std::tuple_size specialization for vec.

Namespaces

- namespace trisycl

  The vector type to be used as SYCL vector.
- namespace std

Macros

- #define TRISYCL_DECLARE_S(x)

  Accessors to access hex indexed elements of a vector.
- #define TRISYCL_GEN_SWIZ2(str, idx0, idx1)
- #define TRISYCL_GEN_SWIZ3(str, idx0, idx1, idx2)
- #define TRISYCL_GEN_SWIZ4(str, idx0, idx1, idx2, idx3)
- #define TRISYCL_DEFINE_VEC_TYPE_SIZE(type, size, actual_type) using type##size = vec<actual_type, size>;

  A macro to define type alias, such as for type=uchar, size=4 and actual_type=unsigned char, uchar4 is equivalent to vec<unsigned char, 4>
- #define TRISYCL_DEFINE_VEC_TYPE(type, actual_type)

  Declare the vector types of a type for all the sizes.

Typedefs

- template<typename DataType , int numElements>
  using trisycl::__swizzled_vec__ = vec< DataType, numElements >

Functions

- template<int I, typename T , int Size>
  auto std::get (const trisycl::vec< T, Size > &v)

  Provide a get<> accessor to have C++17 structured binding working.

13.191.1 Detailed Description

Implement the small vector class.

```

Include dependency graph for vec.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class trisycl::detail::vec< DataType, NumElements >

  forward declaration to use in the detail class

Namespaces

- namespace trisycl

  The vector type to be used as SYCL vector.
- namespace trisycl::detail

  Some global triSYCL configuration.

Typedefs

- template<typename DataType , int numElements>
  using trisycl::detail::__swizzled_base_vec__ = vec< DataType, numElements >

13.193.1 Detailed Description

Implement the detail base SYCL vector class.

Classes

- class trisycl::accessor< DataType, Dimensions, AccessMode, Target >

  The accessor abstracts the way buffer or pipe data are accessed inside a kernel in a multidimensional variable length array way. More...
- class trisycl::accessor< DataType, 1, AccessMode, access::target::pipe >

  The pipe accessor abstracts the way pipe data are accessed inside a kernel. More...
- class trisycl::accessor< DataType, 1, AccessMode, access::target::blocking_pipe >

  The pipe accessor abstracts the way pipe data are accessed inside a kernel. More...
- class trisycl::host_accessor< DataType, Dimensions, AccessMode >

  SYCL 2020 host_accessor. More...

Namespaces

- namespace trisycl

  The vector type to be used as SYCL vector.
- namespace trisycl::sycl_2_2

Functions

- template<typename Accessor >
  static auto & trisycl::get_pipe_detail (Accessor &a)

  Top-level function to break circular dependencies on the the types to get the pipe implementation.

13.244 accessor.hpp

Include dependency graph for connection.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class trisycl::vendor::xilinx::acap::aie::axi_packet
- struct trisycl::vendor::xilinx::acap::aie::axi_packet::shutdown_t

  Marker type used to signal network shutdown.
- class trisycl::vendor::xilinx::acap::aie::communicator_port

  Abstract interface for a communication port.

- class trisycl::vendor::xilinx::acap::aie::fifo_channel

  A FIFO channel connection.
- class trisycl::vendor::xilinx::acap::aie::port_receiver< AXIStreamSwich >

  A router input port directing to an AIE core input or a BLI input.
- struct trisycl::vendor::xilinx::acap::aie::port

  Abstraction of a communication port.
- struct trisycl::vendor::xilinx::acap::aie::port::shim

  Abstraction of a communication port inside a shim tile.
- struct trisycl::vendor::xilinx::acap::aie::port::tile

  Abstraction of a communication port inside a tile.
- struct trisycl::vendor::xilinx::acap::aie::connection

  A connection between some AXI Stream Switch.
- struct trisycl::vendor::xilinx::acap::aie::connection::base

  Base class of connection port.
- struct trisycl::vendor::xilinx::acap::aie::connection::input

  Abstract an input port.
- struct trisycl::vendor::xilinx::acap::aie::connection::output

  Abstract an output port.

Include dependency graph for connection.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class trisycl::vendor::xilinx::acap::aie::axi_packet
- struct trisycl::vendor::xilinx::acap::aie::axi_packet::shutdown_t

  Marker type used to signal network shutdown.
- class trisycl::vendor::xilinx::acap::aie::communicator_port

  Abstract interface for a communication port.

- class trisycl::vendor::xilinx::acap::aie::fifo_channel

  A FIFO channel connection.
- class trisycl::vendor::xilinx::acap::aie::port_receiver< AXIStreamSwich >

  A router input port directing to an AIE core input or a BLI input.
- struct trisycl::vendor::xilinx::acap::aie::port

  Abstraction of a communication port.
- struct trisycl::vendor::xilinx::acap::aie::port::shim

  Abstraction of a communication port inside a shim tile.
- struct trisycl::vendor::xilinx::acap::aie::port::tile

  Abstraction of a communication port inside a tile.
- struct trisycl::vendor::xilinx::acap::aie::connection

  A connection between some AXI Stream Switch.
- struct trisycl::vendor::xilinx::acap::aie::connection::base

  Base class of connection port.
- struct trisycl::vendor::xilinx::acap::aie::connection::input

  Abstract an input port.
- struct trisycl::vendor::xilinx::acap::aie::connection::output

  Abstract an output port.

00024
00025 /** The AI Engine tile infrastructure defining the program of a tile
00026
00027 This is the type you need to inherit from to define the program of
00028 a CGRA tile.
00029
00030 \param AIE_Program is the type representing the full CGRA with the
00031 programs and memory contents
00032
00033 \param X is the horizontal coordinate of the memory module
00034
00035 \param Y is the vertical coordinate of the memory module
00036
00037 \todo (Andrew Gozillon) FYI, until Intel fix the way they handle
00038 base classes in the SYCL compiler frontend this tile_base can
00039 never have non-default constructed data (on the device side
00040 implementation, the host should be fine to have whatever).  As the
00041 hack I have in place just now only outlines a call to the base
00042 classes default constructor, it might be feasible to work around
00043 that though by calling a base class "fill" function in the tile
00044 constructor or tweaking the way the run function of a tile is
00045 outlined so that it outlines it as a copy of the full object
00046 rather than components of the object and reconstructing it inside
00047 the kernel (although you'll fall into the standard layout trap as
00048 you'll be passing a full object to the kernel invocation and it'd
00049 take some reworking of the Tile's main generation).
00050
00051 A proper fix for this is probably quite difficult as you'd need to
00052 take into account the base classes dependencies among-st other
00053 things like the constructor body not being available in the same
00054 TU, some discussion here:  https://github.com/intel/llvm/issues/488

00024
00025 /** The AI Engine tile infrastructure defining the program of a tile
00026
00027 This is the type you need to inherit from to define the program of
00028 a CGRA tile.
00029
00030 \param AIE_Program is the type representing the full CGRA with the
00031 programs and memory contents
00032
00033 \param X is the horizontal coordinate of the memory module
00034
00035 \param Y is the vertical coordinate of the memory module
00036
00037 \todo (Andrew Gozillon) FYI, until Intel fix the way they handle
00038 base classes in the SYCL compiler frontend this tile_base can
00039 never have non-default constructed data (on the device side
00040 implementation, the host should be fine to have whatever).  As the
00041 hack I have in place just now only outlines a call to the base
00042 classes default constructor, it might be feasible to work around
00043 that though by calling a base class "fill" function in the tile
00044 constructor or tweaking the way the run function of a tile is
00045 outlined so that it outlines it as a copy of the full object
00046 rather than components of the object and reconstructing it inside
00047 the kernel (although you'll fall into the standard layout trap as
00048 you'll be passing a full object to the kernel invocation and it'd
00049 take some reworking of the Tile's main generation).
00050
00051 A proper fix for this is probably quite difficult as you'd need to
00052 take into account the base classes dependencies among-st other
00053 things like the constructor body not being available in the same
00054 TU, some discussion here:  https://github.com/intel/llvm/issues/488

13.377.1 Detailed Description

The basic AI Engine homogeneous tile, with the common infrastructure to all the tiles, i.e.

independent of x & y coordinates, but also from the tile program itself.

This tile can be seen as the SYCL subdevice of the raw CGRA SYCL device to run elemental functions.

This is owned by the device, so for example the AXI stream switch configuration and packet can survive to some program changes.

13.379.1 Detailed Description

The basic AI Engine homogeneous tile, with the common infrastructure to all the tiles, i.e.

independent of x & y coordinates, but also from the tile program itself.

This tile can be seen as the raw CGRA subdevice to run elemental functions.

This is owned by the device, so for example the AXI stream switch configuration and packet can survive to some program changes.

13.383.1 Detailed Description

The basic AI Engine homogeneous tile, with the common infrastructure to all the tiles, i.e.

independent of x & y coordinates, but also from the tile program itself.

This tile can be seen as the raw CGRA subdevice to run elemental functions.

This is owned by the device, so for example the AXI stream switch configuration and packet can survive to some program changes.

Include dependency graph for debug.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- struct trisycl::detail::debug< T >

  Class used to trace the construction, copy-construction, move-construction and destruction of classes that inherit from it. More...
- struct trisycl::detail::display_vector< T >

  Class used to display a vector-like type of classes that inherit from it. More...

Namespaces

- namespace trisycl

  The vector type to be used as SYCL vector.
- namespace trisycl::detail

  Some global triSYCL configuration.

Macros

- #define TRISYCL_INTERNAL_DUMP(expression)

  Dump a debug message in a formatted way.
- #define TRISYCL_DUMP(expression) TRISYCL_INTERNAL_DUMP(expression)
- #define TRISYCL_DUMP_T(expression)

  Same as TRISYCL_DUMP() but with thread id first.

Functions

- template<typename KernelName , typename Functor >
  auto trisycl::detail::trace_kernel (Functor f)

  Wrap a kernel functor in some tracing messages to have start/stop information when TRISYCL_TRACE_KERNEL macro is defined.

13.387.1 Macro Definition Documentation

13.387.1.1 TRISYCL_DUMP

```
#define TRISYCL_DUMP(
              expression ) TRISYCL_INTERNAL_DUMP(expression)
```

Definition at line 44 of file debug.hpp.

13.387.1.2 TRISYCL_DUMP_T

```
#define TRISYCL_DUMP_T(
              expression )
```

Value:

```
  TRISYCL_DUMP("Thread " « std::hex                                    \
               « std::this_thread::get_id() « ":  " « expression)
```

Same as TRISYCL_DUMP() but with thread id first.

Definition at line 47 of file debug.hpp.

13.387.1.3 TRISYCL_INTERNAL_DUMP

```
#define TRISYCL_INTERNAL_DUMP(
              expression )
```

Value:

```
    do {       \
    std::ostringstream s;                            \
    s « expression;                                  \
    BOOST_LOG_TRIVIAL(debug) « s.str();              \
  } while(0)
```

Dump a debug message in a formatted way.

Use an intermediate ostringstream because there are issues with BOOST_LOG_TRIVIAL to display C strings

Definition at line 36 of file debug.hpp.

13.397 include/triSYCL/vendor/Xilinx/config.hpp File Reference

Control the configuration of some implementation of Xilinx-related features.

This graph shows which files directly or indirectly include this file:

Macros

- #define TRISYCL_XILINX_AIE_FIBER_EXECUTOR_THREADS 8

  Define the number of threads used in the fiber executor by default if undefined in the compiler option.
- #define TRISYCL_XILINX_AIE_TILE_CODE_ON_FIBER 0

  Do not use a fiber to run the tile core program by default if undefined in the compiler option.

13.397.1 Detailed Description

Control the configuration of some implementation of Xilinx-related features.

Include dependency graph for partition_array.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- struct trisycl::vendor::xilinx::partition::cyclic< PhyMemNum, PDim >

Represent a cyclic partition.

- struct trisycl::vendor::xilinx::partition::block< ElmInEachPhyMem, PDim >

  Represent a block partition.

- struct trisycl::vendor::xilinx::partition::complete< PDim >

  Represent a complete partition.

- struct trisycl::vendor::xilinx::partition::none

  Represent a none partition.

- struct trisycl::vendor::xilinx::partition_array< ValueType, Size, PartitionType >

  Define an array class with partition feature. More...

Namespaces

- namespace trisycl

  The vector type to be used as SYCL vector.

- namespace trisycl::vendor
- namespace trisycl::vendor::xilinx
- namespace trisycl::vendor::xilinx::partition

  Kind of array partition.

Enumerations

- enum class trisycl::vendor::xilinx::partition::type { trisycl::vendor::xilinx::partition::cyclic , trisycl::vendor::xilinx::partition::block , trisycl::vendor::xilinx::partition::complete , trisycl::vendor::xilinx::partition::none , trisycl::vendor::xilinx::partition::cyclic , trisycl::vendor::xilinx::partition::block , trisycl::vendor::xilinx::partition::complete , trisycl::vendor::xilinx::partition::none }

  Three real partition types: cyclic, block, complete.

`#include <gtkmm.h>`
Include dependency graph for graphics.hpp:

Classes

- struct trisycl::vendor::xilinx::graphics::frame_grid

  An application window displaying a grid of tiles.
- struct trisycl::vendor::xilinx::graphics::palette

  Color palette to project a linear data space to an RGB color space.
- struct trisycl::vendor::xilinx::graphics::image_grid

  An application window displaying a grid of tiled images.
- struct trisycl::vendor::xilinx::graphics::application

  A graphics application running in a separate thread to display images in a grid of tiles.

Namespaces

- namespace trisycl

  The vector type to be used as SYCL vector.
- namespace trisycl::vendor
- namespace trisycl::vendor::xilinx
- namespace trisycl::vendor::xilinx::graphics

Typedefs

- using trisycl::vendor::xilinx::graphics::rgb = std::array< std::uint8_t, 3 >

Include dependency graph for graphics.hpp:

Classes

- struct trisycl::vendor::xilinx::graphics::frame_grid

  An application window displaying a grid of tiles.
- struct trisycl::vendor::xilinx::graphics::palette

  Color palette to project a linear data space to an RGB color space.
- struct trisycl::vendor::xilinx::graphics::image_grid

  An application window displaying a grid of tiled images.
- struct trisycl::vendor::xilinx::graphics::application

  A graphics application running in a separate thread to display images in a grid of tiles.

Namespaces

- namespace trisycl

  The vector type to be used as SYCL vector.
- namespace trisycl::vendor
- namespace trisycl::vendor::xilinx
- namespace trisycl::vendor::xilinx::graphics
